

Athena Progress – February 10, 2016 – 11:30am

Minutes:

- 1) XXXXX & XXXXX still working Hera issues

Achievements:

- 1) Fixed – if a remote dynamic config file is used, it was not being deleted on uninstall
- 2) Fixed – if a killtimeout was specified, it would uninstall even if a new killtimeout was received during a beacon cycle
- 3) Changed – app.wsgi to use os.path.dirname(__file__) instead of “/var/www/html” – assuming the app.wsgi and Server.py are in the same directory.
- 4) Fixed – install / offline installer for Bravo

Test Status:

- 1) Dart Testing – testing HERA

Issues:

- 1) Athena is failing on Win10 install – possible issue with hook method
- 2) Bravo is still not working until reboot – possible permissions issue
- 3) Athena – get large pdf file – comes back corrupt
- 4) Athena – get large file – stop machine – file does not continue
- 5) Athena – set failed beacons to 5 – this does not uninstall after 5
- 6) Athena – memload does not work with test dll?
