Subject: CBEP Global Bat Alliance meeting
Location: Hilton Alexandria Mark Center; exact location TBD

Start: Thursday, February 09, 2017 1:30 PM EST
End: Thursday, February 09, 2017 2:30 PM EST
Show Time As: Busy

Recurrence: None

Meeting Status: Not yet responded

Organizer: Flegler, Ayanna J CTR (US)
Required Attendees: Flegler, Ayanna J CTR (US) >; Stokes, Martha M CIV (US) l>; Lancaster, Mary J CIV (US) < Jon Epstein ecohealthalliance.org>; Gavin James Smith >; Ian Mendenhall @ecohealthalliance.org ecohealthalliance.org>; Kading,Rebekah >; vkapur ; jkmazet >; kityrob >; joram.buza >

CBEP would like to convene researchers from all CBEP-engaged regions to discuss formation of a Global Bat Alliance (GBA). The GBA will aim to build and leverage country and regional capabilities to generate an enhanced understanding of bats and their ecology within the context of pathogens of security concern. This meeting will serve to discuss future collaborative efforts of the Global Bat Alliance.

Subject: BOHRN Meeting Agenda and Materials 20 - 21 June
Attachment(s): "INSTRUCTIONSResearchQuadChart_BOHRN.pdf","Blank_ResearchQuadChart.docx","BOHRN Agenda v.5[6].pdf"

All,

The final agenda for our BOHRN 20 – 21 June meeting is attached. Our meeting will be held in the Garden South Meeting Room at the Hilton Garden Inn in Saskatoon (90 22 St. E, Saskatoon, SK S7K 3X6, Canada).

From our discussions in January we built in time to discuss your current research, as part of this event's agenda. In order to maintain time for BOHRN discussions, we are asking for you to fill out the attached quad chart. Quad charts are designed to give a quick overview of information. Therefore, please don't try to fit all of your research into the boxes, just important points or conclusions you would like to provide to the group. **Please review and fill in the quad chart prior to our meeting, and plan on presenting your chart in 5 minutes during the first day**.

We are requesting that you email your quad chart back **NLT Monday, 18 June**. Attached are instructions and a blank quad chart. Be advised that we will only project one slide, therefore all information must fit within the attached chart provided.

Let us know if you have any questions regarding any of the documents. **As a reminder we will need a completed quad chart from you NLT 18 June.** We look forward to seeing everyone next week in Canada.

Thank you,

Megan

TECHNICAL DESCRIPTION AND OBJECTIVES

APPROACH

MILESTONES, SCHEDULE, AND STATUS

IMPACT

BOHRN STEERING COMMITTEE MEETING
20 -21 June 2018
Saskatoon, Canada

Hilton Garden Inn, Saskatoon Canada
Garden South Meeting room

Wednesday 20 June 2018 Day 1	
0900 – 1000	Executive Committee Meeting Only
1000 – 1045	Welcoming Remarks
1045 – 1100	House Keeping and Admin
1100 – 1130	BOHRN updates from January
1130 – 1145	Working Break
1145 – 1300	Current Research and Interest (quad chart presentations)
1300 – 1400	Working Lunch
1400 – 1600	Breakout Group Session
(1500 – 1530)	Working Break
1600 – 1630	Brief-out of Breakout Groups
1630 – 1645	Day 2 Agenda Review
Thursday 21 June 2018 Day 2	
0900 – 1000	Breakout Group – Review of Day 1
1000 – 1030	Large Group Discussion of next steps
1030 – 1045	Working Break
1045 – 1145	Network Analysis
1145 – 1215	BTCD Introduction
1215 – 1315	Working Lunch
1315 – 1345	Novel work at the Lugar Center – Tbilisi, Georgia
1345 – 1415	Large Group question and answer on BTCD
1415 – 1430	Working Break
1430 – 1500	Live edits of BTCD agenda
1500 – 1600	Next Steps

Quad Chart Instructions: Please fill out all four portions of the quad chart. The chart is read in a clockwise direction starting with the technical description. This activity is intended to provide a big picture overview and not an in-depth report of your research. Please limit the text to provide only the most important aspects of each quad. You will be given 5 minutes to present the information within this chart. Refer to the questions in each box for more guided assistance.

TECHNICAL DESCRIPTION AND OBJECTIVES

Briefly describe the research you are currently conducting and why. What questions are you trying to answer and what is the importance of this research to your field? What is currently known about your research? Consider the following:

1. **Underlying Challenges**

2. **Current State of Understanding**

APPROACH

What are the specific aims of your research, identify the challenges you will face, tools to overcome challenges, and approach to conducting the research. Consider the following:

1. **What can be done to address the challenges?**

2. **What are the key steps along the way**

3. **What tools and technologies are needed to address the challenges?**

MILESTONES, SCHEDULE, AND STATUS

Briefly explain the timeline of your research. When do you anticipate your research to be completed? Are there deliverables or steps along the way that will show substantial progress? Consider the following:

1. **Provide timeline for delivery**

2. **Quick overview on project status**

IMPACT

Describe the potential impact of your research. What will the impact be for the regional area? Globally? Will this lead to the need for future studies? Consider the following:

1. **Define the quantitative impact of project.**

2. **Define the regional and global impact.**

Subject: BOHRN Steering Committee/One Health Congress Meeting

All,

You are receiving this email, as part of a save the date to attend our BOHRN Steering Committee meeting and the 5th International One Health Congress (OHC) in Saskatoon, Canada.

Our meeting will take place on 20-21 June (location TBD, though likely at the Hilton Garden Inn). The agenda and travel information for this two day event will follow shortly. The OHC will take place 22-25 June.

On behalf of Dr. Marty Stoke and Dr. Mary Lancaster, CBEP will provide funding your travel and registration to the OHC and BOHRN Planning Meeting. While the OHC is not required it would be a good opportunity for networking on behalf of BOHRN. CBEP will be paying for OHC attendance next week. **Therefore, we need you to confirm your attendance to the OHC NLT tomorrow 23 March.** However, please note if regulations for DoD travel are not met by the specified due date, funding for the conference and travel will not be provided.

Please respond with your availability to attend the meeting NLT 23 March.

v/r,

Megan

Attachment(s): "JKO SERE ATFP ISOPREP Instructions NOV 2016.doc","dd1351-2 pdf 1351-2 TRAVEL VOUCHER.pdf","ITO_Information.docx","BPERNet PMAC Meeting_Revision 1.docx","PMAC2018 Provisional Conference Program_as of Oct 27.pdf"

All,

You are receiving this email, as part of a formal invitation to attend our BPERNet Steering Committee meeting and the Prince Mahidol Award Conference (PMAC). This information is a couple weeks late, because we have been waiting to confirm our meeting as an official side meeting of PMAC and solicit invitations to PMAC or the entire team. You should be hearing officially from the PMAC planning committee with official letters of invitation. We understand you are very busy people, so please feel free to attend all or portions of the Conference. I am including the PMAC 2018 Provisional Conference Schedule; you should receive a more updated schedule along with your LOI from the PMAC planning committee.

Our meeting will take place on 30 January (location TBD, though likely at the Centara). The agenda is attached (document: BPERNet PMAC Meeting Revision 1). We had originally scheduled the meeting for 31 January; however, now the entire group will be invited to attend a field trip to a bat habitat at the Wat-Luang Phromawas Temple and interact with villagers who are playing a role in EID prevention and control.

On behalf of Dr. Marty Stoke and Dr. Mary Lancaster, CBEP will be funding your travel, lodging, and meals to the BPERNet Planning Meeting and PMAC via Invitational Travel Orders. Specific instructions may be found below my signature block. Please let us know what portions of the week you will be able to attend. I am creating the list for a hotel room block at the Renaissance Ratchaprasong Hotel, across the street from the PMAC venue.

We very much hope you will be able to attend our meeting and some or all of the conference thereafter. Again, please let me know your plans and begin communication with Nicki at your earliest convenience.

V/r,

Katie Leahy

Travel instructions:
Please fill out the attached document: "ITO_Information" and return it to Aleman, Nicki D NLT 7 December 2017. Some of you have inquired about multi-stops, as you are traveling on to other locations. This should be fine as long as it is within the DoD regulations. Nicki and the travel team will be able to work with you and answer any specific questions you may have.

Because you will be traveling on Department of Defense orders outside the United States, you will need to complete a couple training courses (attached – JKO SERE ATFP ISOPREP Instructions). We advise you to complete this NLT 7 December as well and follow the instructions within the form. Please contact me if you have any questions. Also attached a dd1351 Travel Voucher, which you will complete and submit when you return home.

ITTEE MEETING AGENDA

gen and Ecology Research Network (BPERNet)

0 January – 3 February 2018

Date: Tuesday, 30 January 2018

BPERNet

Time	Session	Notes
0900 - 0915	Introduction and Meeting Objectives	Marty Stokes and Mary Lancaster will welcome all participants and provide a brief overview of the meeting objectives for the week
0915 - 0945	⊦ Review interim accomplishments since 27 June ⊦ Q&A on TORFTA changes ⊦ Call for votes to accept TORFTA	Executive Committee members will provide an overview of the TORFTA and mission areas; all participants will receive final version ahead of meeting
0945 - 1015	Working Group Focus Areas	Review WG focus areas that were outlined during the 27 June meeting
1015 - 1045	Break	
1045 - 1200	Breakout Group Session I	Breakout Group Session 1 Objectives: ⊦ Define WG research areas (sub-focus area definitions) ⊦ List and prioritize research questions and potential projects for each area ⊦ Identify internal and external research dependencies for each Working Group **Working Group 1: researching host / pathogen biology and interactions** (Dr. Deeann Reeder, Dr. Vivek Kapur, Dr. Joram Buza) **Working Group 2: researching pathogen surveillance, diagnostic capacity, and epidemiology** (Dr. Abel Wade, Dr. Jon Epstein, Dr. Catalino Demetria, Dr. Lela Urushadze, Dr. Supaporn Wacharapluesadee, Dr. Tamar Kutateladze)

		Working Group 3: researching ecology (bat, domesticated animal, and wildlife interface) (Dr. Paul Cryan, Dr. Tigga Kingston, Dr. Robert Kityo) **Working Group 4: researching human – bat interactions and risk characterization** (Dr. Kevin Olival, Dr. Ian Mendenhall)
1200 – 1330	Working lunch / Open discussion	Open discussion objectives Þ Discuss group marketing campaign Þ Members should be prepared to introduce other network affiliations, conferences, and meeting opportunities to market the network, globally Þ Discuss long-term process to collect and collate applications to the network
1330 – 1430	Breakout Group Session I Brief-out	Each group briefs out their discussions according to the objectives; brief-out 10 minutes / WG; Q&A 5 minutes / WG
1430 – 1515	Breakout Group Session II	Breakout Group Session 2 Objectives: Þ List out WG research coverage (who is researching what and where) Þ Identify research gaps and needs Þ Identify WG resource and coverage needs (e.g., target environmentalists in Europe); identify critical POCs for membership Þ Begin drafting short and long timelines and work plans
1515 – 1545	Tea Break	
1545 – 1645	Breakout Group Session II Brief-out	Each group briefs out their discussions according to the objectives; brief-out 10 minutes / WG; Q&A 5 minutes / WG
1645 – 1715	End of session	End of Session Objectives: Þ Review Action Items Þ Discuss date, level of participation, and location for next meeting (all participants should come prepared to briefly discuss their ideas for this topic)

PRIVACY ACT STATEMENT

AUTHORITY: 5 U.S.C. Section 5701, 37 U.S.C. Sections 404 - 427, 5 U.S.C. Section 301, DoDFMR 7000.14-R, Vol. 9, and E.O. 9397.

PRINCIPAL PURPOSE(S): This record is used for reviewing, approving, accounting, and disbursing money for claims submitted by Department of Defense (DoD) travelers for official Government travel. The Social Security number (SSN) is used to maintain a numerical identification **filing system for filing and retrieving individual claims.**

ROUTINE USE(S): Disclosures are permitted under 5 U.S.C. 552a(b), Privacy Act of 1974, as amended. In addition, information may be disclosed to the Internal Revenue Service for travel allowances, which are subject to Federal income taxes, and for any DoD "Blanket Routine Use" as published in the Federal Register.

DISCLOSURE: Voluntary; however, failure to furnish the information requested may result in total or partial denial of the amount claimed.

PENALTY STATEMENT

There are severe criminal and civil penalties for knowingly submitting a false, fictitious, or fraudulent claim (U.S. Code, Title 18, Sections 287 and 1001 and Title 31, Section 3729).

INSTRUCTIONS

ITEM 1 - PAYMENT

Member must be on electronic funds (EFT) to participate in split disbursement. Split disbursement is a payment method by which you may elect to pay your official travel card bill and forward the remaining settlement dollars to your predesignated account. For example, $250.00 in the "Amount to Government Travel Charge Card" block means that $250.00 of your travel settlement will be electronically sent to the charge card company. Any dollars remaining on this settlement will automatically be sent to your predesignated account. Should you elect to send more dollars than you are entitled, "all" of the settlement will be forwarded to the charge card company. Notification: you will receive your regular monthly billing statement from the Government Travel Charge Card contractor; it will state: paid by Government, $250.00, 0 due. If you forwarded less dollars than you owe, the statement will read as: paid by Government, $250.00, $15.00 now due. Payment by check is made to travelers only when EFT payment is not directed.

REQUIRED ATTACHMENTS

1. Original and/or copies of all travel orders/authorizations and amendments, as applicable.
2. Two copies of dependent travel authorization if issued.
3. Copies of secretarial approval of travel if claim concerns parents who either did not reside in your household before their travel and/or will not reside in your household after travel.
4. Copy of GTR, MTA or ticket used.
5. Hotel/motel receipts and any item of expense claimed in an amount of $75.00 or more.
6. Other attachments will be as directed.

ITEM 15 - ITINERARY - SYMBOLS

15c. MEANS/MODE OF TRAVEL *(Use two letters)*

GTR/TKT or CBA *(See Note)*	- T	Automobile	- A
Government Transportation	- G	Motorcycle	- M
Commercial Transportation *(Own expense)*	- C	Bus	- B
		Plane	- P
Privately Owned Conveyance *(POC)*	- P	Rail	- R
		Vessel	- V

Note: Transportation tickets purchased with a CBA must not be claimed in Item 18 as a reimbursable expense.

15d. REASON FOR STOP

Authorized Delay	- AD	Leave En Route	- LV
Authorized Return	- AR	Mission Complete	- MC
Awaiting Transportation	- AT	Temporary Duty	- TD
Hospital Admittance	- HA	Voluntary Return	- VR
Hospital Discharge	- HD		

ITEM 15e. LODGING COST
Enter the total cost for lodging.

ITEM 19 - DEDUCTIBLE MEALS
Meals consumed by a member/employee when furnished with or without charge incident to an official assignment by sources other than a government mess *(see JFTR, par. U4125-A3g and JTR, par. C4554-B for definition of deductible meals)*. Meals furnished on commercial aircraft or by private individuals are not considered deductible meals.

29. REMARKS

a. INDICATE DATES ON WHICH LEAVE WAS TAKEN:

b. ALL UNUSED TICKETS *(including identification of unused "e-tickets")* MUST BE TURNED IN TO THE T/O OR CTO.

“Invitational Travel Orders”

Please make sure to password protect this file (send password in a separate email if possible) when emailing it back to due to the sensitivity of information on this form

The information required below is requested to support (fund) your travel via the Defense Travel System (DTS). The travel POC for ITO’s is: Mrs. Carron Leslie .
Carron will assist in coordinating your airfare via the system, our logistics contractor Tech Trans International (TTI) will reserve your hotel room separately. ***Please note:*** You will be “**self-pay”** for lodging (hotel) upon check in using your government issued Credit Card and or other card (for non-USG).

Once travel has been completed you are responsible for completing a DD1351 (Travel Voucher Form) for reimbursement of your expenses such as lodging, per-diem M&IE, ground transport if applicable, please note meals provided on travel by the event organizers will be deducted. The Travel Voucher form will need to be submitted to both contacts listed above after you have returned from your trip.

Reimbursement will be deposited at the designated account you list below. If you have any questions or concerns please contact: Nicki Aleman

JKO – SERE 100 – ATFP – ISOPREP Completion Instructions

- These instructions are for Civilians and Contractors without a Common Access Card (CAC).
- When emailing, use your Work Email address. - Training is not required by Foreign Nationals.

1. JKO Course # JS-US007: Level I Antiterrorism Awareness Training: Valid for 12 Months.
Training can be accessed via link below. You do not need a JKO account to access training.
Click link below. When site opens up, click OK to close DOD Security Banner after reading.
Click on Non-CAC users under JS-007 Level I Antiterrorism Awareness Training, and follow instructions.
https://jkodirect.jten.mil/Atlas2/faces/page/login/Login.seam

2. JKO Course J3TA-US1329, SERE 100.2 Level A SERE Education and Training in Support of the Code of Conduct (FOUO): Valid for 36 Months or AS REQUIRED BY THE FOREIGN CLEARANCE GUIDE. FREQUENCY SUBJECT TO CHANGE.
To complete SERE training follow these instructions. Click on the following link. http://jko.jten.mil/index.html on the page that opens up, click on enter JKO. Read the Security Banner then click OK to close. On the page you are viewing now, under **I DO NOT have a CaC, select Non-Government Personnel/Sponsored Account Registration.**
On the next page, fill out the requested information. In the Reason for Account, after you enter reason, add the CBEP Country Manager and Country you are supporting. Not providing this information will cause delays. Then click submit. My email is John.T.Patterson2.civ@mail.mil.
When you click submit it will send a notice to me. I will verify reason with Country manager and submit request. The JKO office will contact you with your logon information. Once you have obtained your log on information, return to https://jkodirect.jten.mil/Atlas2/faces/page/login/Login.seam to log into JKO. Once logged in, select the Catalog Tab at top of page and enter "SERE" in title/keyword box, and click search. SERE 100.2 Level A SERE Education and Training in Support of the Code of Conduct (FOUO) - (4 hrs) should be listed. Click enroll to access course.
If you get an out of office notice from me, you will have to resubmit your request using the CBEP Country Manager's email address that you are supporting, they can sponsor you. You may want to check before submitting request.

Contact JKO at JKOHelpDesk@jten.mil or 757-203-5654 for access issues.

DO NOT send form by email or regular mail. Once blocks 50-54 are completed the form is classified CONFIDENTIAL. And must be sent using shipping instructions on page 2

3. DD Form 1833 Isolated Personnel Report (ISOPREP): Valid 12 Months or AS REQUIRED BY THE FOREIGN CLEARANCE GUIDE. FREQUENCY SUBJECT TO CHANGE.

If you have a DOD CAC, click on link below and follow instructions to complete your **initial ISOPREP**. You must be on a .mil or .gov domain computer system.
https://prmsglobal.prms.af.mil/prmsconv/Profile/Survey/start.aspx

If you need to update or want to verify your ISOPREP, contact one of individuals listed below.

If you are in the local area, you may contact John.T.Patterson2.civ@mail.mil / 703-767-5938 to arrange completion of your ISOPREP at the CTR office. If you receive an out of office response, you may contact theodore.w.carlson.civ@mail.mil / 703-767-6382 for assistance. Use these same contacts for updates.

If you do not have a DOD CAC, and are not in the local area, fill out DD Form 1833. This can be found by searching online. Instructions are included in form. Finger prints are not required. Section 9 blocks 50-54 should be typed on separate piece of paper and included with the form. Once completed, form is classified as Confidential and must be sent following instructions on page 2. Your SSN is needed. You Blood type is needed. Your DOB is needed. Make sure to follow the instructions for the 4 Statements and the Authentication Number.

Submit two photos, a front view and right side profile view, from the shoulders up. Photos may be sent with the form or the preferred method is to email the photos only to John.T.Patterson2.civ@mail.mil

DO NOT send form by email or regular mail. Once blocks 50-54 are completed the form is classified CONFIDENTIAL. Send using instructions below

Mailing Instructions

Seal package with type of tape to retain postal stamp impressions. Prepare, package, and securely seal classified material in ways to MAXIMIZE evidence of tampering and MINIMIZE undetected deliberate compromise, or risk of accidental exposure. To minimize the risk of exposure of classified information, package documents so that classified material is not in direct contact with the inner envelope or container (e.g., fold so classified material faces together).
Double wrap classified information in two opaque, sealed envelopes, wrappings, or containers, durable enough to properly protect the material from accidental exposure and facilitate detection of tampering.
Do not place classification marking or any other unusual marks on the outer package that might invite special attention to the fact that the contents are classified

After completing form, fold so classified information faces together. Place folded form, disk or photos if you did not email them inside fully addressed and marked package as instructed and shown below.

Form	Inner Package	Outer Package
CONF IDEN TIAL	Full Name CONFIDENTIAL Full Address (Mark Front and Back) ATTN: J3CTB/John Patterson and CTR	Office Name Only Office Address See proper address

Inner Package:

Mark inner package as shown above. Be sure to replace the CTR CBEP Country Managers' name shown with the actual name you are supporting.

- Complete recipients and sender address
- Mark top/bottom and front/ back with CONFIDENTIAL markings.
- Seal package as stated at top of this page.

Place this package inside of another package (outer package).

Outer Package:

Mark outer package as shown above.

- Use only office name and office address. Do not use individual names.
- Do not use markings of any kind indicating classification or that the package contains classified material.
- Seal package as stated at top of this page.
- Send package via USPS, FEDEX, UPS, DHL, etc. Make sure you have a tracking # for Package.
- After sending package notify John.T.Patterson2.civ@mail.mil, and applicable CTR CBEP Country Manager so we are aware to be watching for package.

Use correct address below depending on shipper. Make sure you have a tracking number for your package.

PRINCE MAHIDOL AWARD CONFERENCE 2018

Making the World Safe from the Threats of Emerging Infectious Diseases

Background

The Prince Mahidol Award Conference (PMAC) is an annual international conference focusing on policy-related health issues. The Prince Mahidol Award Conference 2018 is co-hosted by the Prince Mahidol Award Foundation, the Thai Ministry of Public Health, Mahidol University, the World Health Organization, The World Bank, U.S Agency for International Development, Japan International Cooperation Agency, The Rockefeller Foundation, with support from other key related partners. The Conference will be held in Bangkok, Thailand, from 29 January – 3 February 2018. The theme for PMAC 2018 is "Making the World Safe from the Threats of Emerging Infectious Diseases".

We live in an era when the emergence of novel infectious disease agents is posing an increasing threat to global health and security. The threat from novel infectious diseases is accelerating at a pace and with an intensity unprecedented in human history, driven by increasing human populations, climate change and surging global travel. The possibility that a single lethal microbe could suddenly emerge and sweep through every household, through every community without regard to national borders or social and economic standing is a shared fear across the globe. Just the fear can cost billions, as illustrated by recent Ebola and Zika virus panics in little-affected countries. But the reality of the threat is all too clear, proven by the decades of response to the HIV-AIDS pandemic. Yet the world is not prepared to either mitigate the impact of an emergent disease threat or prevent its emergence.

Zoonotic and AMR related diseases account for more than 95% of all emerging infectious diseases reported during the second half of the 20th century[1]. In this century the emergence of SARS, pandemic influenza, MERS, and the spread of Ebola and Zika reflect the world's increasing vulnerability to novel zoonotic threats. The simultaneous emergence of pathogens resistant to antibiotic therapies raises the prospect of a "post antibiotic" world. While the drivers underlying the emergence of zoonotic and antibiotic resistant diseases are complex, human behaviours and their impact on animal populations and the environment are understood to be central to the emergence of both disease threats. The role of increasing animal-human contact in the emergence of zoonotic diseases has been well documented and been increasingly the focus of One Health initiatives across the globe. The contribution made by the inappropriate use of antibiotics in animal husbandry to AMR is less well documented but in recent years has been increasingly understood to be a core driver behind the emergence and global spread of antibiotic resistant organisms, along with inappropriate "prescriber-user" practices associated with antibiotic use in clinical care. Changing environmental and climatic conditions have also been closely linked to the emergence of novel infectious diseases. That infectious disease emergence is closely associated with practices and

[1] K. E. Jones *et al.*, Global trends in emerging infectious diseases. *Nature* **451**, 990-993 (2008).

behaviours at the animal-human-environment interface speak to the importance of an expanded multi-sectoral alliance across the animal, human and environmental sectors to address the threats posed by both zoonosis and AMR. The Global Health Security Agenda and related One Health movement provide important frameworks for mobilizing international action.

The Rising Threat of Zoonotic Diseases

Since the Influenza Pandemic of 1918 when between 50-100 million died (5-10% of the human population) we have been fully aware of how vulnerable our place on this planet is.

Even in the absence of significant global mortality, epidemics and pandemics can cost tens of billions of dollars, reversing development gains and pushing communities and households into poverty. The SARS outbreak in 2003 cost the economies of East Asia between $30-50 billion and estimates of the global economic cost of an influenza pandemic range from $374 billion, for a mild pandemic, to $7.3 trillion, for a severe pandemic - with a 12.6% loss of gross domestic product.

Strategically, policies to address a potential pandemic threat are constrained by an unresolved debate over the use of adaptive measures - that aim through the use of technological measures to reduce the impact of diseases after they have emerged vs mitigation measures - that focus on the underlying causes of disease emergence. The adaptive tools we traditionally rely on to protect us from the world of infectious diseases – vaccine and therapeutics – too often are shown ineffective against a novel threat; and, the timely development and deployment of new and effective biomedical countermeasures is undercut by the speed at which the threat spreads.

Similarly, our ability to mitigate the emergence of new threats is undermined by a lack of knowledge about the viral ecology and the drivers, including human behaviors, which propel the emergence of a new threat. It is at these moments we realize just how few our adaptive and mitigation options are – and how vulnerable the global community is. After each episode the world admonishes itself for being ill prepared to deal with a global threat – but after decades of largely reacting adaptively to each event, with only a tangential focus on mitigation, we are only marginally better able to deal with the next one.

A “Post Antibiotic World”

The development and commercialization of antimicrobials stands as a defining achievement of 20th century medical practice. Antimicrobials heralded an era of expanded life expectancy, paved the way for advanced medical and surgical treatments, improved animal health and welfare, and made possible curative therapy for once fatal infections. Decades of superfluous and inattentive use of antimicrobials across the human and animal health sectors now threaten these advancements. The pace of reported treatment failures and antimicrobial resistance (AMR) in common pathogens is increasing, with multi-drug resistant pathogens creating the prospect of a ‘post antibiotic’ world. In the absence of interventions, AMR-associated human mortality is projected to soar from a current rate of 700 000 to over 10 million annually by 2050—as readily treatable infections become life threatening, and routine procedures are rendered unsafe.[2] Asia is expected to account for half of this projected global mortality. The impact of AMR on morbidity and mortality is matched by a substantial economic burden, with resistance linked to aggregate losses anticipated to exceed USD 100 trillion by 2050.

[2] O’Neill, J. Review on Antimicrobial Resistance. Tackling a Global Health Crisis: Initial Steps. 2015

Antimicrobial resistance is exacerbated by the unregulated use of antimicrobials across both the human health and animal health sectors. A particular concern is the shared use of same classes of antibiotics in humans and in animals, potentially exacerbating the selection pressures on pathogen populations in animals and humans that encourage the development of resistance and exchange of resistance genes. By example, in the United States the livestock production industry accounts for 80% of the total use of antibiotics used for treatment of human infections.

Antimicrobial resistance is one of the three flagship topics for the tripartite (FAO, OIE and WHO) collaboration. At the Sixty-eight World Health Assembly in May 2015, the World Health Assembly endorsed the Global Action Plan (GAP)[3] on AMR and requested to strengthen the tripartite collaboration between FAO, OIE and WHO for combating antimicrobial resistance in the spirit of the "One Health" approach. The Global Action Plan, which ensured a One Health approach and consistency with Codex Alimentarius and OIE inter-governmental standards and guidelines, aims to ensure continuity of successful treatment and prevention of infectious diseases with effective and safe medicines that are quality-assured, used in a responsible way, and accessible to all who need them. Guided by this global action plan, the Member States, the Secretariat, and their international and national partners aim to: (1) improve awareness and understanding of antimicrobial resistance; (2) strengthen knowledge through surveillance and research; (3) reduce the incidence of infection; (4) optimize the use of antimicrobial agents; and (5) develop the economic case for sustainable investment that takes account of the needs of all countries, and increase investment in new medicines, diagnostic tools, vaccines and other interventions.

A high level meeting on anti-microbial resistance was held in September 2016 at the United Nations General Assembly, generating a statement of global commitment to address AMR through a multi-disciplinary approach.[4]

PMAC 2018 Will Be Action Focused. Protecting the world from the threat of zoonotic diseases and ensuring effective stewardship of antibiotics requires a common and well-coordinated multi-sectoral effort. While there has been significant progress in building multi-sectoral One Health action against zoonotic diseases, AMR efforts remain highly siloed with an unequal focus on the respective contributions made by the inappropriate use of antibiotics in clinical care and animal production, as well as limited opportunities for bringing human, animal and environmental health sectors together to forge a common strategy. There is an urgent need to bring a comprehensive One Health risk mitigation approach to address zoonotic and AMR related diseases that addresses the direct consequences of animal-human interactions and contributory pressures related to environmental and climate changes.

PMAC 2018 will provide an important setting for fostering policy and strategic action by engaging multi-sectoral experts in zoonosis and AMR, as well as climate change and related environmental fields from across the public and private sectors, international organizations, foundations, academics and non-governmental organizations, as well as critical players in Global Health Security Agenda (GHSA). Importantly, a PMAC sponsored "Making the World Safe from the Threats of Emerging Infectious Diseases" would build on PMAC 13's highly successful conference on One Health and lead to real change.

PMAC 2018 Will Build On Past PMAC Themes. Since 2007, the Prince Mahidol Award Conference has been organized as an annual international conference focusing on policy-related public health issues of global significance – including, Universal Health Coverage, Health Equity, Meeting the

[3] Global Action Plan on Antimicrobial Resistance, http://www.who.int/drugresistance/global_action_plan/en/
[4] http://www.un.org/pga/71/2016/09/21/press-release-hl-meeting-on-antimicrobial-resistance/

Needs of Vulnerable Populations, and addressing the threats posed by infectious diseases. Each of these meeting has brought together leading public health leaders and stakeholders from around the world to propose concrete solutions and recommendations. PMAC 2018 will explicitly look to build on the successes of past PMACs and to identify opportunities to further contribute to the systems and capacities required to address the comprehensive health needs of the world's populations

Objectives

1. To accelerate progress in the adoption of multi-sectoral approaches for addressing zoonotic diseases and antimicrobial resistance
2. To advocate for evidence-based priority setting and policy decisions for zoonotic diseases and antimicrobial resistance
3. To share knowledge and experience in addressing the challenges posed by zoonotic diseases and antimicrobial resistance
4. To promote a greater understanding of the range and nature of the "drivers" underlying the emergence of new disease threats and options for their mitigation
5. To highlight emerging demographic, climatic and travel trends to better understand how disease emergence will evolve over the course of this century
6. To underscore the collateral socio-economic and development benefits associated with a One Health Agenda

Sub-themes

Sub-theme 1: Learning from the Past: Towards Effective and Sustainable Policies, Practices and Capacities for "Prevention, Detection and Response" to Emerging Zoonosis and Antimicrobial Resistance

This sub-theme is focused on presenting evidence for how efforts across the globe over the past two decades to address zoonotic and AMR related threats are contributing to more effective policies, practices and capacities for "prevention, detection and response" to EIDs. Given the inherent multi-sectoral aspects of disease emergence this is an opportunity to learn from recent experience with efforts such as the Global Health Security Agenda (GHSA), International Health Regulations, the One Health movement, and other platforms illustrating challenges and solutions for building effective partnerships for addressing zoonosis and AMR.

Issues to be discussed under this sub-theme are:

1. Evidence for optimal policies, regulations and systems for addressing EIDs
    - What we have learned from country, regional and global level experiences in addressing EIDs
        - Case studies illustrating successes and failures; how well do we manage and mitigate present threats (e.g. MERS CoV, Nipah virus, Zika virus, Zoonotic Influenza, Ebola virus, AMR, and others)
        - Organizational options for building sustainable national-level partnerships across multi-ministerial groups, including Health, Agriculture, Environment, Finance and Education
            - What are the policy requirements
            - What are the human resource requirements
            - What are the organization requirements

        - What are resource requirements
    - How are these experiences translated to the sub-national level
        - What are the equivalent requirements for provincial/county level operations

2. Evidence for optimal global and regional level structures for addressing EIDs

- What are the lessons learned on building global and regional level partnerships, including the GHSA, One Health and Planetary Health, to address EIDs
    - How effective have global and regional partnerships been in building multi-sectoral alliances to enable country level actions
        - What are the policy requirements
        - What are the human resource requirements
        - What are the organization requirements
        - What are resource requirements

- What is the evidence for proactive, flexible structures that enhance capacities and preparedness across the prevention-detection-response continuum?
    - What have we learned from the pandemic vaccine development banks; consortia for conservation of antimicrobials?
    - What can we learn from parallel efforts, such as those addressing global climate change and carbon emissions?
    - What examples demonstrate the ability to bridge the apparent dichotomy between capacity building and a research agenda concerning emerging zoonoses and AMR?

3. Evidence of novel, upstream approaches to earlier detection and trends monitoring, including but not limited to:

- Novel surveillance postures and strategies,
- digital diseases detection,
- crowdsourcing big data,
- predictive analytics on disease distribution

4. Evidence for more sustainable approaches for “prevention, detection and response”

- What are examples of sustainable financing structures? What have we learned from:
    - The World Bank Pandemic Emergency Financing Facility?
    - Evolving schemes for engaging insurance companies to “share” pandemic risk?
    - Efforts to quantify cost attributable to zoonotic disease and AMR burden, project pandemic influenza economic impact, and make a credible investment case for prevention and risk mitigation?
- What are examples of “preparedness” activities that address long-term sustainability?
    - What have we learned from the World Bank and WHO’s joint effort to develop strategies for both pandemic and “all hazards” preparedness and related long-term financing schemes?
- Which financing models have proven utility in employing an evidence driven approach to discouraging high risk practices and incentivizing risk mitigation in approaching pandemic prevention as a global public good?

Sub-theme 2: Harnessing the Power of Public-Private-Community (PPC) Partnerships for "Preventing, Detecting, and Responding" to Zoonosis and AMR

This sub-theme is focused on examining the evidence for building effective partnerships that bring together community, private sector and public sector resources for sustainably addressing the threats posed by zoonosis and AMR. As with the previous sub-theme, the inherently multi-sectoral nature of zoonosis and AMR requires active engagement across multiple stakeholders. In addition to the Public sector, Private sector actors who may be directly engaged in activities that inadvertently contribute to "drivers" for EIDs will need to be actively involved in any efforts to better mitigate the consequences of their activities. Similarly, communities are key stakeholders, both as consumers and potential contributors to some of the drivers that underlie disease emergence (e.g. inappropriate use of antibiotics in rearing of livestock and aquaculture)

Issues to be discussed under this sub-theme are:

1. Evidence for strong PPC partnerships that have contributed to "prevention, detection and response" to Zoonosis and AMR

- What are the lessons from PPC partnerships in addressing EIDs
    - Country, regional or global examples of how PPC partnerships have been able to harness across each of the constituencies to address EIDs in ways that greatly enhanced the overall impact
        - What were the incentives for PPC partnerships
        - What were the roles and responsibilities of each group
        - What were the metrics for valuing the PPC partnerships
        - What were the operational factors for sustainability of PPC parntership

2. Evidence of successful outreach and community empowerment
    - What are examples of how risk communications have successfully affected community and/or individual level practices and behaviors on a scale significant enough to reduce the risk from zoonotic threats and/or AMR

3. Evidence for an active and sustainable engagement of the private sector
    - What are examples of how private sector partners have been actively and sustainably engaged in efforts to address zoonotic threats and/or AMR
    - What can be learned from partnerships with biomedical industry in developing and marketing vaccines and medical countermeasures? Employing novel diagnostic platforms enabling rapid detection and response to emerging threats?
    - What are examples of partnerships with industry in the use of non-medical countermeasures within communities to help mitigate, prevent, and control infectious disease threats? Employing new technologies and platforms for health communication and the application of non-pharmaceutical interventions.

4. Evidence for how consumer advocacy can contribute to change policies and practices

5. Evidence of economic benefits from PPC

Sub-theme 3: Understanding the Selection Pressures Underlying Emergence of Zoonotic Diseases and Antimicrobial Resistance and the Broad Benefits Realized From Promoting Healthy Animals and Healthy People

This sub-theme is focused on both:

a) exploring the contributions made by climate change, population growth, global travel, habitat change, expanding settlements, resource extraction, increased livestock and crop production and other underlying drivers that contribute to the emergence of new zoonotic and anti-microbial disease threats, and
b) examining the broad benefits that are accrued from promoting practices across multiple sectors that aim at reducing these drivers and the risk of zoonotic diseases and antimicrobial resistance.

There has been a general recognition that the adoption of a core set of best practices that are designed to directly target the drivers associated with zoonosis and AMR are likely to simultaneously contribute to positive outcomes across a range of "other" domains and the achievement of the United Nations Sustainable Development Goals, such as food security, household wealth and economic growth, as well as healthier environments and sustainable communities.

a) Issues to be discussed under this sub-theme will allow a presentation of the evidence for the drivers of EID emergence:

1. Evidence for Climate Change in Increasing Infectious Disease threats and models projecting future impact

- How does climate change contribute to spread of infectious disease threats
    - Topics to be considered could include: impact on vector ecology, animal migration, altered range and distribution of reservoir host species;
    - variance in freshwater availability, sanitation, and waterborne disease

2. Evidence for demographic and population change on increasing Infectious Disease threats, including how settlement patterns (peri-urbanization), population movement (increased air travel, trade etc), habitat change (impact on animal bio-diversity) contribute to disease emergence and spread

3. Evidence for how increased economic activity impacts on increased Infectious Disease risk, including how expanded incursions of extractive industry operations and agricultural intensification into wildlife domains increase risk for "spillover" and spread of novel diseases

- Options for how "risk" can be mitigated at the site of industry operations or in planning/selecting where industry operations occur

4. Evidence for how increased livestock production and marketing in geographic "hot spots" for disease emergence may increase risk of pathogen "spillover" and spread

- How projected increases in livestock production in Africa and shifting production contexts in Asia over the 21st century will impact on the risk of disease emergence, including zoonosis and AMR
    - Models for likely changes in terrestrial and aquatic animal production and marketing patterns over the coming century
    - Models for potential increased environmental impact that could elevate risk
    - Options for minimizing risks associated with increased livestock production and marketing

- Considering the impact of a global supply chain of agricultural commodities and production inputs (e.g. animal feed), and trans-continental risk management strategies

b) Issues to be discussed under this sub-theme also will allow a presentation of the evidence to broad collateral benefits accrued from targeting the drivers of EID emergence:

5. Evidence that adoption of practices to reduce zoonotic and AMR risks associated with livestock production would also contribute to more efficient and more profitable operations.

- How do improved biosecurity and husbandry practices that strengthen control of pathogenic zoonotic viruses improve the overall health of livestock and the environment
  - Reduced animal diseases
  - Improved animal health can lead to increased livestock productivity and reduced input costs for production
  - Enhanced productivity and yield per animal production unit
  - Reduction in prophylactic antibiotic use

- How does proper management of antimicrobials in livestock production and aquaculture improve economic returns
  - Improved hygienic conditions, nutrition, and vaccination in animal husbandry associated with reduced use of antibiotics and corresponding returns on investment
  - What can be learned from the experience of countries that have phased out and enacted regulatory controls on use of antimicrobials in animal production
  - AMR reduces potency of veterinary drugs and negatively affects animal health
  - Consumer demand for antimicrobial residue free animal source foods
  - Market based incentives and penalties for reduced antimicrobial use and enhanced adherence to drug withholding periods, minimizing residues in products entering the food chain
  - Best practices in strengthening antimicrobial usage regulatory and enforcement structures in animal production

6. Evidence that reduction in habitat fragmentation has led to the control of zoonosis

- How does habitat fragmentation impact on both vector-borne and non vector-borne diseases
  - Evidence that changes in habitat leads to changes (increase/decrease) the transmission dynamics of infectious diseases (e.g. chikungunya, malaria)

7. Evidence that that the real and/or projected economic impact from emerging zoonoses and AMR has informed resource allocation policies and an investment case for prevention

- What practices and approaches have shown promise in fostering decision making informed by economic analyses
- What novel structures have proven utility in transcending the challenge of inequitable sectoral cost and benefit distribution
  - Evidence for one or more sectors bearing the cost for benefits accruing to different sectors/stakeholders (e.g. H7N9 control in China: costs borne by producers and markets, but benefits accrue to health sector; or resource extraction and disease emergence: costs borne by health sector, but benefits accrue to industry and land planning/mining/forestry entities)

Venue and Dates of the Conference

Centara Grand at Central World Hotel, Bangkok

Monday 29 – Tuesday 30 January 2018	Side Meetings
Wednesday 31 January 2018	Field Trip
Thursday 1 – Saturday 3 February 2018	Main Conference

Structure of the Conference

This is a closed, invitation only conference host by the Prince Mahidol Award Foundation, and the Royal Thai Government, together with other international co-hosts. The conference consists of:

1. **Pre-conference**
    a. Side meetings
    b. Field trip

2. **Main conference**
    a. Keynote speeches
    b. Plenary sessions
    c. Parallel sessions
    d. Synthesis: Summary and recommendations
    e. Poster display

Pre-Conference Program

Monday 29 January 2018

09:00-17:30	Side Meetings

Tuesday 30 January 2018

09:00-17:30	Side Meetings

Wednesday 31 January 2018

06:30–18:00	Field Trip

Main Conference Program

Thursday 1 February 2018

09:00-10:30	**Opening Session & Keynote Address** Opening Session by **Her Royal Highness Princess Maha Chakri Sirindhorn** Keynote Address • Prince Mahidol Award Laureate 2017 • Prince Mahidol Award Laureate 2017 • **TBC**
10:30-11:00	Break
11:00-12:30	**Plenary 0: Vision 2100: Re-Imagining the End Game for the End of the Pandemic Era**
12:30-13:30	Lunch
13:30-14:30	**Plenary 1: Leadership Needed for Managing Emerging Infectious Diseases of the 21st Century**
14:30-16:30	**PS1.1: Lessons Learned in Managing Emerging Infectious Diseases (EID)** **PS1.2: Strategic Information and the Evolution of Emerging Infectious Diseases: Lessons from the Past and New Opportunities** **PS1.3: Safeguarding Medicines in the Era of AMR: What Do We Know? What Works?** **PS1.4: Financing Pandemic Preparedness: Where is the Money?** **PS1.5: One Health on the Move: Nomadic Communities**
16:30-17:00	Break
17:00-18:00	**Plenary 2: Futures of Partnerships for a Safer World**

Friday 2 February 2018

08:30-09:30	**Plenary 3: Managing Emerging Infectious Disease and AMR Risk across the Livestock Revolution**
09:30-10:00	Break
10:00-12:00	**PS2.1: Beyond MERS and Zika: Are we Prepared for the Next Big Epidemic?** **PS2.2: AMR: Addressing Excessive and Inappropriate Use of Antibiotics** **PS2.3: Dealing with an Inter-Connected World: Partnerships for Preparedness, Detection and Response during Mass Gatherings** **PS2.4: Changing Dynamics: Emerging Infectious Diseases and Antimicrobial Resistance in an Era of Expanding Global Human Population Growth and Movement** **PS2.5: Reducing the Gap: Addressing Neglected Disease; Neglected Populations**
12:00-13:00	Lunch
13:00-15:00	**PS3.1:** **PS3.2: Lessons Learned from a One Health Approach to AMR** **PS3.3: Climate Change and Emerging Diseases: The Importance of Resilient Societies** **PS3.4:**

	PS3.5: Policy Coherence: Effective Partnerships for Global Health
15:00-15:30	Break
15:30-17:30	**PS4.1: Moving Forward and Outward: Progress in Implementation of Global Frameworks and Initiatives** **PS4.2: Multi-sectoral Partnerships for Action on AMR** **PS4.3: Community Systems: the Bedrock of Responses to EID and AMR** **PS4.4: Finding the Win-Win Solutions for Better Health from Better Food Systems** **PS4.5: Bringing Solutions into Focus: Harnessing the Power of an Economic Lens**
18:00-20:30	**Welcome Dinner** • **Welcome Speech** by - Minister, Ministry of Public Health, Thailand - President, Mahidol University, Thailand • **Dinner Speech** by **Bill Gates**, Bill and Melinda Gates Foundation, USA (TBC)

Saturday 3 February 2018

09.00-09.30	**Closing Session** • **Speech** by **Margaret Chan**, Former Director General, World Health Organization, Switzerland (TBC)
09.30-10.30	**Synthesis: Summary, Conclusion & Recommendations**
10.30-11.00	**Statement**
11.00-12.00	**Closing Performance**
12.00-13.30	Lunch
14:00-16:30	**International Organizing Committee (IOC) Meeting for PMAC 2018/2019**

OPENING SESSION AND KEYNOTE ADDRESS

Opening Session

by Her Royal Highness Princess Maha Chakri Sirindhorn

PLENARY 0 (PL0)

Vision 2100: Re-Imagining the End Game for the End of the Pandemic Era

Background

We live in an era when the emergence of novel infectious disease agents is posing an increasing threat to global health and security. The threat from novel infectious diseases is accelerating at a pace and with an intensity unprecedented in human history, driven by increasing human populations, climate change and surging global travel. The possibility that a single lethal microbe could suddenly emerge and sweep through every household, through every community without regard to national borders or social and economic standing is a shared fear across the globe. Just the fear can cost billions, as illustrated by recent Ebola and Zika virus panics in little-affected countries. But the reality of the threat is all too clear, proven by the decades of response to the HIV-AIDS pandemic.

Zoonotic and AMR related diseases account for more than 95% of all emerging infectious diseases reported during the second half of the 20th century[5]. In this century the emergence of SARS, pandemic influenza, MERS, and the spread of Ebola and Zika reflect the world's increasing vulnerability to novel zoonotic threats. The simultaneous emergence of pathogens resistant to antibiotic therapies raises the prospect of a "post antibiotic" world. While the drivers underlying the emergence of zoonotic and antibiotic resistant diseases are complex, human behaviours and their impact on animal populations and the environment are understood to be central to the emergence of both disease threats. The role of increasing animal-human contact in the emergence of zoonotic diseases has been well documented and been increasingly the focus of One Health initiatives across the globe. The contribution made by the inappropriate use of antibiotics in animal husbandry to AMR is less well documented but in recent years has been increasingly understood to be a core driver behind the emergence and global spread of antibiotic resistant organisms, along with inappropriate "prescriber-user" practices associated with antibiotic use in clinical care. Changing environmental and climatic conditions have also been closely linked to the emergence of novel infectious diseases. That infectious disease emergence is closely associated with practices and behaviours at the animal-human-environment interface speak to the importance of an expanded multi-sectoral alliance across the animal, human and environmental sectors to address the threats posed by both zoonosis and AMR.

As we look forward towards the end of this century, the predictable escalation in the interactions between humans and animals speaks to a world of increasing global risk. The consequences of these trends, however, are avoidable. Success in "making the world safe from the threats of emerging infectious diseases" requires we think and act differently; to not continue with the half-measures that have made the world ill prepared to address these threats.

Rapid advances in science and a corresponding revolution in technologies allow us, for the first time, to imagine a world where these "threats" can be minimized. What is required is bold action; that embraces an aggressive time horizon; and, that is global in scope. Such action can build systems and

[5] K. E. Jones *et al.*, Global trends in emerging infectious diseases. *Nature* **451**, 990-993 (2008).

capacities able to mitigate the emergence of future threats and to control them when they do. With this knowledge comes the power to end panic and move to prevention.

This Plenary will present and discuss examples of new, innovative and bold global ventures which are now laying the groundwork for the "beginning of the end of the Pandemic Era".

Objectives

- Explore novel and transformative approaches that address the underlying drivers of zoonotic disease and AMR
- Harness methodologies, technologies, and thinking across a range of disciplines to promote a vision for a proactive approach to emerging zoonoses and AMR
- Enable a conversation that transcends current impediments and envisions possible pathways and enabling factors to realize the end of the "pandemic era"

Moderator

- **Dennis Carroll**, USAID

Keynote Speaker

- **Harvey Feinberg,** President, The Gordon and Betty Moore Foundation

Panelists

- **Richard Hatchett**, CEO, Coalition for Epidemic Preparedness Innovations (CEPI)
- **George Gao**, Director, China Center for Disease Control and Prevention
- **Margaret Hamburg**, President, American Association for the Advancement of Science (AAAS)
- **Larry Brilliant**, Chairman, Skoll Global Threats Fund

Note: All speakers to be confirmed

PLENARY 1 (PL1)

Leadership Needed for Managing Emerging Infectious Diseases of the 21st Century

Background

We now live in a world where any local infectious disease outbreak event has the potential to become an epidemic or pandemic. While preparedness of local agencies is key to quickly identify and contain outbreaks, global partnerships and international collaboration across all sectors must be effective to support and manage events. These partnerships have the potential to proactively alter the global architecture in order to quickly detect, prevent and respond to infectious disease threats as they emerge.

The plenary session will address the *Leadership Needed for Managing Emerging Infectious Diseases of the 21st Century*. It will set the scene of the global health architecture and how the international community is organizing to address effectively EIDs. It will also address leadership needed at country level for managing emerging infectious diseases.

The session will feature speakers from organizations with recent experience of preparing for, and responding to global health crises in the 21st century and consider how, as risks, environment and global architecture change, funding varies, how organizations change and adapt to tackle the contemporary challenges, and how are the lessons learned from recent challenges being incorporated into plans for future events. Speakers from countries and civil societies will bring a national and community level perspective on how to respond to global health crises.

Objectives

The objective is to identify what kind of leadership, at all levels, is needed to address the increased risk and the complexity of EID and AMR and bring together different partners and groups acknowledging the various organizational and sectoral cultures.

Moderator

- **Sylvie Briand**, WHO, Director Infectious Hazard Management

Panelists

- **Peter Salama**, EXD, WHO's Health Emergencies Programme – WHO perspective-
- **Elhadj As Sy**, Secretary General of the IFRC – civil society and community perspective
- **Francoise Barré-Sinoussi**, Nobel Prize Awardee for HIV discovery, Institute Pasteur – perspective on HIV pandemic management
- **Oly Ilunga Kalenga**, DRC MOH – country perspective

Note: All speakers to be confirmed

PLENARY 2 (PL2)

Futures of Partnerships for a Safer World

Background

This plenary is an interactive session that will introduce four core questions, based on the Futures approach, to shape the discourse of partnerships for greater biosecurity in the world. It will begin with an introduction of Futures thinking by Dr. Sohail Inayatullah, UNESCO Chair of Futures Studies and Professor at Tamkang University, Taiwan. Then, the plenary will involve a short discussion on the current state of partnerships or lack of in certain thematic areas, and challenges in forging effective partnerships. It will delve into exploring various futures for partnerships and what effective and inclusive partnerships can achieve to make the world a safer place for all. Attempting to jointly uncover the "unknown unknowns" within a Futures methodology will lead to an innovative approach in organizing an interactive plenary that would hopefully lead to new directions and interesting discussions within the parallel sessions.

Objectives

- To jointly envision possible scenarios for the future of partnerships in EID and AMR.
- To generate excitement in creating effective partnerships for a safer world by imagining alternate futures based on Futures techniques. It is envisioned that the novelty of the technique will add to the richness of PMAC and to bring in cross-disciplinary approaches into a Public Health conference.
- To get participants to think creatively in an out-of-the-box manner on working collaboratively together to build greater biosecurity for all.

Moderator

- **Sohail Inayatullah**, who is experienced in working on Biosecurity issues as well as other Development challenges

Panelists

- **Diah Saminarsih**, Special Advisor to Minister, Ministry of Health Indonesia, Indonesia
- **Sania Nishtar**, President, Heartfile, Pakistan
- **Ken Banks**, Founder, FrontlineSMS, United Kingdom

Note: All speakers to be confirmed

PLENARY 3 (PL3)

Managing Emerging Infectious Disease and AMR Risk across the Livestock Revolution

Background

Widespread demand for animal protein nutrition over the last half century has fueled an explosive growth in global livestock production systems. Between 2000 and 2030, demand for beef and dairy is expected to nearly double, and poultry to nearly triple. In select high growth regions, such as South Asia, demand for poultry is expected to soar to 725%.[6] Keeping pace with this demand, the production, marketing, and distribution of terrestrial and aquatic animal production has undergone transformational change. While rural livelihoods globally remain largely dependent upon grain, tubercle, and legume-based nutrition, an overall consolidation and commercialization of the production and marketing chains is shifting the disease emergence risk profile.

Increasingly, global animal product supply chains impact disease risk variably, through secondary and tertiary order effects that may be geographically separated. Within the context of zoonotic disease emergence risk, what are the linkages across geographically distinct areas where demand for animal protein is growing, the production of that protein, and the production of inputs such as animal feed? Can a total "emergence risk footprint" be developed to quantify this risk and prioritize reduced impact production scenarios? And what incentives and structures are needed to expedite a global shift toward such lower impact production systems?

The collective capacity to mitigate emerging zoonotic disease and AMR risks associated with increasingly complex global animal production chains will be dependent upon a robust understanding of the disease transmission drivers within these global systems. This session will enable a detailed evaluation of the role of animal production in potentiating zoonotic disease emergence and AMR, and will identify commonalities across regions, production contexts, and sectors that can inform applied risk mitigation approaches. While the session will focus on animal production systems, a balance with the role of anti-microbial use in crops, animal feed, and human health will need to be included.

Objectives

- Evaluation of terrestrial and aquatic animal production systems within the context of emerging zoonotic disease and AMR risk
- Understand how projected increases in livestock production in Africa and shifting production contexts in Asia over the 21st century will impact the future of farming systems and the risk of emerging zoonoses and AMR
- Identify common risk threads across regions, production contexts, and sectors that can inform applied risk mitigation approaches
    - Exploration of what is known about the quality and integrity of veterinary medicines - and their supply chains - used in animal production and their contribution to AMR risk.

[6] FAO. 2011. *Mapping supply and demand for animal-source foods to 2030,* T.P. Robinson & F. Pozzi. Animal Production and Health Working Paper. No. 2. Rome

- Review practical options for minimizing risks associated with increased animal production and marketing

Moderator

- **Dennis Carroll**, USAID

Panelists

- **Simplice Nouala**, African Union Interafrican Bureau of Animal Resources
- **Ugo Picaciamarra**, FAO
- **Peter Daszak**, EcoHealth Alliance
- **Dan Schar**, USAID

Note: All speakers to be confirmed

PARALLEL SESSION 1.1 (PS1.1)

Lessons Learned in Managing Emerging Infectious Diseases (EID)

Background

Several outbreaks since 2000 have shaped the way in which we prepare for and respond to infectious diseases outbreaks. The emergence of SARS CoV in the first years of this century was a wakeup call to the global health community followed by H5N1 avian influenza outbreaks and the first influenza pandemic in the 21st century. The renewed IHR (2005) marked a major change in the approach to global health security, going beyond specific diseases to apply to all health risks, irrespective of their origin or source.

Objectives

To present and discuss the management of a selection of recent crisis in different settings and draw lessons for the future. The session will tackle what works, what doesn't work from the political, public health, social and economic perspectives.

The following events will be discussed:

- **Ebola** : management of local and extended outbreaks: comparison of local outbreaks (DRC Uganda) and the epidemic in West Africa (2014-2015) with a particular emphasis on :
  - Community engagement and the socio-cultural aspects of outbreak response;
  - Cross-border collaboration between neighboring countries (surveillance, contact tracing, case management);
  - The role of international assistance;
  - Clinical management and vaccine.
- **MERS**: limiting spread example of Kingdome of Saudi Arabia, Republic of Korea and Thailand, managing the regional and global aspects of MERS-CoV, with a particular emphasis on:
  - Monitoring the health of international travelers and migrant workers;
  - Hospital preparedness
- **Zika and yellow fever** : managing vector borne outbreaks and emerging infectious diseases in Brazil / Angola (Yellow fever) and mitigating the risk of international spread (example of Portugal), with a particular emphasis on:
  - Controlling vectors and other environmental factors;
  - Vaccination and other preventive measures;
  - Effective communication to address public fear and potential panic.
- *Also **potentially discussed** : From SARS to influenza A(H7N9); lessons learned in China, with a particular emphasis on:*
  - *Addressing the human-animal interface and cross-sectoral collaboration;*
  - *Resolving conflicting interests between the commercial and public health sectors*
  - *Strengthening preparedness based on experience of past outbreaks*

Keywords: Ebola, Zika, MERS, Influenza, contact tracing, clinical management, migrations.

Moderator

- **Ron St John**, Public Health Agency of Canada

Panelists

- **Bruce Aylward**, WHO, Special Representative for Ebola Response – Ebola response
- **Adullah Assiri**, KSA MOH – MERS (country of origin)
- Director General, Department of Disease Control, Ministry of Health, Thailand
- **João Paulo Toledo**, Director, surveillance department, Ministry of Health, Brazil
- **Francisco George**, Portugal MOH – yellow fever: stockpiling and preventing importation and spread of infectious viruses

Note: All speakers to be confirmed

PARALLEL SESSION 1.2 (PS1.2)

Strategic Information and the Evolution of Emerging Infectious Diseases: Lessons from the Past and New Opportunities

Background

The last century has witnessed an increase in the frequency of emerging infectious diseases (EID) and antimicrobial resistance (AMR). Climate change, environmental pressure, population movement, population growth and increasing overlaps between human and animal livelihoods have contributed to an acceleration of novel infectious diseases. In addition, the increasing pace of human and animal pathogens resistant to antibiotic therapies raises serious concerns about treatable infections becoming life threatening, raising the death toll and the economic cost to potentially unsustainable level within decades.

In this context, early warning systems and strategic information play a key role in preventing, detecting and responding adequately to emerging zoonosis and antimicrobial resistance. More surveillance systems are needed. New technologies, electronic health records, internet and social media have the potential to provide timely information on emerging infectious diseases and antimicrobial resistance that can supplement traditional surveillance systems. With these new tools, individuals and their communities can play a new role in participatory syndromic surveillance. Nevertheless, there are important caveats that need to be addressed, such as ensuring data privacy, underrepresentation of some categories such as infants, the elderly, or people lacking access to these new technologies.

Objectives

This session will look at the recent changes in strategic information and how can they contribute to current surveillance systems in order to identify appropriate actions and interventions for preparedness and response to emerging infectious diseases and antimicrobial resistance.

Moderator

- TBD

Panelists

- Shweta Bansal, Department of Biology, Georgetown University, Washington, USA
- Laurel Sprague, Executive Director GNP+, The Hague, The Netherlands
- Marcel Salathé, Centre for Infectious Disease Dynamics, Penn State University, Pennsylvania, USA or Caroline Guerrisi Sorbonne University, INSERM
- Margaret D. Straton, Tufts University Initiative for Forecasting and Modelling of Infectious Diseases (InForMID), Medford, Massachusetts, USA or Sarah Del Valle, Los Alamos National Laboratory New Mexico, USA
- Osama Ahmed Hassan, Umea University, Sweden, Public Health Institute, Khartoum, Sudan
- Amy Wesolowski, Centre for Communicable Disease Dynamics, Harvard TH Chan School of Public Health

Note: All speakers to be confirmed

PARALLEL SESSION 1.3 (PS1.3)

Safeguarding Medicines in the Era of AMR: What Do We Know? What Works?

Background

The prevention, detection and mitigation of emerging and re-emerging infectious diseases involve both applying preventive controls in animal production as well as ensuring the safety, efficacy, quality, and appropriate use of vaccines, diagnostics and medicines through secure supply chains and health delivery systems.

Complex and fragmented supply chains, especially in countries and regions with limited regulatory and quality oversight, increase the likelihood of substandard, fraudulent or adulterated medicines entering the market. Poor quality medicines ensure microbial replication in the presence of drug pressure. Substandard and falsified medicines also contribute to lack of efficacy and adverse events, undermining trust in the health system. Inappropriate use of anti-microbials is another driver of AMR. Both poor quality medicines and inappropriate use are preventable and can be addressed through the development of robust regulatory and quality assurance systems, treatment guidelines and enforcement.

While there are major limitations in evidence and best practice in the human health sector, even less is known in the veterinary sector, both with respect to use and quality of antibiotics in animals, and effective controls. Further, environmental factors are beginning to come to light.

Objectives

- Review evidence of what is known about the links between medicines quality and AMR.
- Highlight successful efforts in, and benefits from, strengthening systems that monitor and strive to improve medicines quality.
- Address environmental impacts of antibiotic manufacturing on AMR.
- Relate frameworks for addressing medicines quality and appropriate use in the human sector to the animal sector and discern what lessons and approaches from other initiatives could be mobilized to address these drivers of infectious disease risk and AMR.

Moderator

- **Katherine Bond** – overview of issue/session and introduction

Panelists

- Panelist 1 – Overview of evidence linking medicines quality and use to AMR; directions for more attention and link to current response (Proposed: **Michael Deats**, WHO)
- Panelist 2 – Reflections on effective strategies, approaches and benefits to strengthen medicines quality monitoring and quality assurance systems (Proposed: **Margareth Ndomondo-Sigonda**, Tanzania)

- Panelist 3 – Reflections on veterinary sector; insights into how approaches on drug quality and use in human health sector could be applied in the veterinary health sector (Proposed: **Angkana Sommanustwichai**, London School of Hygiene and Tropical Medicine/IHPP Thailand
- Panelist 4 – **Sasi Jaroenpoj**, Head of Veterinary Medicinal Product, Department of Livestock Development, Ministry of Agriculture, Thailand
- Panelist 5 – Environmental impacts of antibiotic production: Proposed: **Dan Andersson**, Department of Biochemistry and Microbiology, Uppsala University, Sweden
- Panelist/Discussant – Broad overview and reflections on how medicines quality and practices contribute to ID and AMR risk from; experience in outbreaks; and links to current initiatives/broad perspectives (Proposed: **Margaret Hamburg**, National Academies of Medicine)

Note: All speakers to be confirmed

PARALLEL SESSION 1.4 (PS1.4)

Financing Pandemic Preparedness: Where is the Money?

Background

Recent experiences with the Ebola, Zika, and SARS outbreaks, among others, have underscored the need for countries to invest in pandemic preparedness, and to do so not only from a health perspective but also from an economic perspective: the socio-economic cost of outbreaks is often proportionally much larger than the corresponding impact on mortality and morbidity.

The International Working Group on Financing Preparedness (IWG) has recently made several recommendations to integrate pandemic preparedness into international macro-economic and market assessments that determine the availability of concessionary and other international financing eligible lower and middle income countries.

To date, however, what has largely been missing in global and country-level discussions is a systematic understanding about adequacy and modality of *current* financing arrangements for health security. Part of pandemic preparedness is embedded in health financing and service delivery. Part also deals with animal health which is the responsibility of livestock/agriculture sector. In addition to its multisectoral nature, there are contingency financing arrangements for pandemic preparedness that may or may not be linked to how countries manage other natural or man-made disasters. There is also risk that health security and pandemic preparedness may get lost in health financing transition that focuses more on financial protection and access to individual services than public goods.

Given the complexity of pandemic preparedness, better understanding of the current financing landscape would enable an informed dialogue on financing gaps and how best they could be filled given domestic and international fiscal constraints. The nature of health security implies that some of the objectives and functions that may be applicable to a generic health financing system would need to be amended to consider some of the unique characteristics of the specific sub-set of activities that constitute health security.

Objectives

The objective of this session is to discuss issues on financing health security within the broader context of trends in health and public financing more generally. Specifically, the session will:

- Provide an overview of how to conceptualize and estimate financing for health security, including preparedness, response and recovery;
- Present and discuss some preliminary findings on health security financing analysis from select countries, including a 10-year evaluation of OIE PVS Pathway and gap analysis to strengthen/finance veterinary services;
- Examine key domestic policies and interventions to ensure sustainable financing for pandemic preparedness and opportunities for mobilizing domestic and international financing for rapid response.

Moderator

- **Timothy Grant Evans**, Senior Director, Health, Nutrition and Population Global Practice. World Bank Group

Panelists

- **Netsanet Workie**, Senior Health Economist, World Bank Group. *Experiences from Health Security Financing Assessment Tool (HSFAT)*
- **Ronella Abila**, OIE sub-regional representative Southeast Asia. *10 years of experience with OIE PVS Pathway*
- **Eduardo Banzon**, Principal Health Specialist, Asian Development Bank. *Financing Health Security in the Mekong Region*
- **Tran Dac Phu**, General Director, General Department of Preventive Medicine, Vietnam. *Country Experience*
- **Julian Naidoo**, Chief of Party, Wits Health Consortium, South Africa. *Country Experience*
- **Benjamin Rolfe**, CEO, Asia Pacific Leaders Malaria Alliance. *Civil Society perspective*

Note: All speakers to be confirmed

PARALLEL SESSION 1.5 (PS1.5)

One Health on the Move: Nomadic Communities

Background

Fully dependent on their animals for their livelihood and income, pastoralists employ mobility as a key strategy to ensure the availability of pasture and water for their herds, thus increasing their resilience. While their movement allows them to overcome the vagaries of nature prevalent in the harsh environments they inhabit, their remoteness and often trans-boundary livelihoods have made it challenging to access services and engage in decision-making. Pastoralist are at the forefront of the human, livestock and wildlife interface. They are especially vulnerable to zoonotic diseases, because they live in close contact with their animals and often consume raw milk and meat. Furthermore changing environmental conditions also affect the availability of pasture for their animals, and in-turn affect their nutrition status.

The animal-human-environment sectors are interconnected and associated with the emergence of infectious diseases as Middle East Respiratory Syndrome (MERS). Multisectoral approaches such as One Health can help address the challenges at this interface by providing adapted vaccinations campaigns and veterinary services to pastoralists.

Objectives

- To foster a deeper understanding of the health risks faced by mobile pastoral communities, and the challenges they encounter in accessing animal and human healthcare
- To share examples of interventions and policies that tackle pastoralists' health issues at the animal-human-environment interface
- To promote the participation of pastoral communities in health policy decisions and sanitation campaigns

Moderator

- **Gregorio Velasco Gil**, Food and Agricultural Organization of the United Nations

Panelists

- **Asiimwe Benon**, Associate Professor. Makerere University
- **Maty Ba Diao**, Regional Coordinator of the Support Pastoralism in Sahelian Countries project- CILSS.
- **Marite Alvarez**, Pastoral representative. Argentina. Pastoamericas.
- **Taghi Farvar**, Pastoral representative. Iran. Cenesta.

Note: All speakers to be confirmed

PARALLEL SESSION 2.1 (PS2.1)

Beyond MERS and Zika: Are we Prepared for the Next Big Epidemic?

Background

Over the past decade, Ebola, MERS, highly pathogenic avian influenza and, more recently, the Zika virus outbreaks have demonstrated the ability of epidemics to devastate communities through both extraordinary losses of life and severe morbidity as well as adverse social and economic impacts that jeopardize global health security. These recent disease outbreaks have not only made evident countries' lack of preparedness to adequately prevent, detect and respond to epidemics, but also the extent to which measures must cut across governance levels and all sectors of society in order to truly be effective. Furthermore, only one third of countries have met their commitments under the International Health Regulations (IHR). And although several tools and frameworks have been developed (by WHO, USAID, CDC, OIE, etc.) to provide guidance for countries to develop country epidemic preparedness and response plans, these are generally disease specific, have not been updated or tested through routine exercises, remain largely underfunded and are, therefore, not fully operational. As a result, many countries remain unprepared to prevent, detect, mitigate risks and respond to health threats and disease epidemics before they cause devastating consequences in the livelihoods of communities and the economies of countries.

Objectives

- To present country experiences on strengthening IHR core capacities, including efforts for effective coordination, partnership models and financing mechanisms to strengthen health security.
- To identify critical elements needed for sustainable, inclusive, and effective preparedness at country level and propose solutions for more effective epidemic preparedness guidance.
- To discuss gaps in the current guidance and frameworks that need to be filled to develop country epidemic preparedness and response plans.

Moderator

- **John Nkengasong**, Director, Africa CDC

Panelists

- **Isabella Ayagah**, IHR Focal Point, Ministry of Health, Kenya. *Strengthening Pandemic Preparedness across Sectors in Kenya: Lessons Learned & the Way Forward*
- **Ronello Abila**, OIE sub-regional representative Southeast Asia. *Lessons Learned from 10yrs of Implementing the OIE PVS Pathway*
- **Tran Dac Phu**, General Director, General Department of Preventive Medicine, Ministry of Health, Vietnam
- **Casey Barton Behravesh**, Director, One Health Office, U.S. CDC

Note: All speakers to be confirmed

PARALLEL SESSION 2.2 (PS2.2)

AMR: Addressing Excessive and Inappropriate Use of Antibiotics

Background

The tripartite, Food and Agricultural Organization, World Health Organization and World Organization for Animal Health and other relevant organizations had declared Antimicrobial resistance (AMR) a serious and growing global public health threat. The loss of effective antibiotics is reducing an ability to protect people from infectious diseases, with profound impacts on healthcare systems, global trade, agriculture, environment and health sectors. Based on World Bank Group projections of the world economy in 2017-2050, if AMR problems continue at the current pace, the annual global GDP would fall by 1.1-3.8% by 2050 and the global healthcare cost would range from US$ 300 billion to more than US$ 1 trillion.

Though AMR is a natural mechanism of pathogen survival; the excessive and inappropriate use of antibiotics are key drivers of the emergence of antimicrobial resistance. Decision to prescribe antibiotics by health professionals still occurs in the absence of adequate information about the nature of the infection or before the results of diagnostic and sensitivity tests become available. Moreover, the regulation of antimicrobial use is poorly enforced in some areas, such as over-the-counter, unregulated use of antibiotic in agriculture, substandard medicines for both human and animal antibiotics.

Several attempts to optimize use of antibiotics in human and animal sectors have shown in the last decade at global, regional and national levels. To fulfill key action proposed by the Global Action Plan, countries need to strengthen the evidence base through surveillances of AMR and the consumption of antimicrobials, and strengthen regulation of the distribution and use of antibiotics in human and animals. The information on AMR and antibiotic consumption will guide the treatment of patients and inform local and national actions. Thus, antibiotic, as a global public good requires regulation on distribution and use.

It is imperative that PMAC audiences recognize the drivers contributing to excessive and inappropriate use of antibiotics; but more importantly, learn and share practical and successful solutions.

Objectives

The panelists in this session will address the following questions

On problem streams

1. Why there are excessive and inappropriate use of antibiotics in humans, animals and crops (i.e. in citrus for treatment of greening disease), such as self-medication of antibiotic from over-the-counter purchases, inefficiently regulated the use of antibiotic. Stakeholder analysis are helpful to unpack the complexity. Key actors involved in the use of antibiotics:
   a) Demand for antibiotics: patients and farmers,
   b) Supply of antibiotics: pharmaceutical industry, professionals: veterinarians, physicians and pharmacists,

On solution streams

2. What are the good practices and lessons for countries or regional organization such as ECDC and networks such as ESAC and ESVAC, to develop and maintain an effective system for surveillance of AMR, antimicrobial consumption and Point prevalence survey in human, and animal?
3. How evidences of surveillance of antimicrobial consumption are used:
    a. To guide antibiotic prescribing decisions of health professionals
    b. To formulate, support and monitor policies which curb down antimicrobial consumption and promote rational use of antibiotics
4. What are the challenges of use of antibiotics in crops? Is there any monitoring system on impacts of antibiotic use in crops, such as antibiotic resistance in food crops and environment, and antibiotic residue in environment and food crops?
5. How does the regulatory system support the control of antibiotic use?

On recommendations

6. What are the policy interventions on "demand" and "supply" sides, which address the excessive and inappropriate use of antibiotics in developing countries?

Moderator

- **Klara Tisocki**, WHO SEARO

Panelists

- **Otto Cars**, Senior Professor, Founder and senior adviser, ReAct-Action on Antibiotic Resistance, Uppsala University, Sweden
- **Jonathan Rushton**, Professor of Animal Health and Food Systems Economics Epidemiology and Population Health, University of Liverpool
- **Lilit Ghazaryan**, Scientific Center of Drug and Medical Technology Expertise, MoH, Armenia
- **Angkana Sommanustweechai**, Doctoral student at LSHTM on AMR, IHPP Thailand

Note: All speakers to be confirmed

PARALLEL SESSION 2.3 (PS2.3)

Dealing with an Inter-Connected World: Partnerships for Preparedness, Detection and Response during Mass Gatherings

Background

Mass gatherings are recognised to have the potential to enhance spread of infectious diseases as well as being potential targets for deliberate events. Although both these risks are unlikely, the rise of Zika infection in the run up to the Rio 2016 Olympic and Paralympic Games and Middle East Respiratory Syndrome (MERS) in Saudi Arabia highlighted how these events can create a perceived, if not actual, global health threat and a political as well as health challenge.

The inspiration of this session derives from the next three Olympiads (Winter 2018, Summer 2020 and Winter 2022) being in the western pacific region (S Korea, Japan and China respectively). This session will be based on previous sporting mass gatherings such as the Rio Olympics, the London Olympics, and the World Cup, religious gatherings such as the Hajj, and large state events such as the King's funeral in Thailand. The session aims to share learning and best practices from a biosecurity and terrorism perspective and to explore how such mass gathering events can best be planned to minimise any health risks. Many mass gatherings, especially international sporting events, are organised by what are effectively private sector companies and the relationship between the private and public sector partners is vitally important.

Objectives

- To share learning and experience from previous events
- To explore effective risk mitigation strategies
- To examine the health and political interface of mass gatherings, including private sector partners
- To explore how mass gatherings can be used to improve global health security capacity

Moderator

- **Brian McCloskey**, Senior Consulting Fellow, Chatham House; Consultant in Global Health Security, Public Health England; & Professor, Faculty Epidemiology and Population Health, London School of Hygiene and Tropical Medicine

Panelists

- **Tina Endericks**, Director, WHO Collaborating Centre on Mass Gatherings and Global Health Security, Public Health England, London
- **Maurizio Barbeschi**, Mass Gathering Unit, WHO, Geneva
- **Lucille Bloomberg**, National Institute Infectious Diseases, South Africa
- **Badriah Alotaibi**, Global Centre for Mass Gathering Medicine, Riyadh, Saudi Arabia
- Speaker (to be identified) from Thailand Ministry of Health
- **Koji Wada**, National Centre for Global Medicine, Tokyo

Note: All speakers to be confirmed

PARALLEL SESSION 2.4 (PS2.4)

Changing Dynamics: Emerging Infectious Diseases and Antimicrobial Resistance in an Era of Expanding Global Human Population Growth and Movement

Background

The global human population is projected to peak at over 11 billion this century. Accelerated human population growth and corresponding changes in demography, along with associated food and companion animal population increases, are altering disease dynamics and will continue to drive emerging infections and transmission over the course of the next century. This session will explore the connections among infectious disease emergence, antimicrobial resistance (AMR), and changing human and animal population dynamics. We will explore the state-of-the-art in emerging disease and AMR detection and forecasting and answer the question, "How can we minimize emerging disease and AMR risks linked to changing demography."

Objectives

This session aims to explore and address the impacts of growing human and animal populations and unplanned mega-cities and peri-urban settlements on disease emergence, amplification, and global distribution. Accordingly, presenters will also tackle the risks associated with surging global trade and travel and illustrate how forecasting can inform risk mitigation.

Specific Objectives:

- Explore projected demographic trends over the 21st century and their impact on expected zoonotic disease emergence and AMR
- Enhance understanding of how trends in demography will differ regionally; how differences in agricultural productivity and marketing practices will impact emerging disease risk, including spread of AMR; and how purchasing power and animal protein demand will have global supply chain impacts and associated emerging disease risk
- Highlight practical, evidence-driven approaches to defining, forecasting, and mitigating human demographic-driven emerging disease risk

Moderator

- **Jonna A.K. Mazet**, University of California, Davis

Speakers

- **Martin (Marty) Cetron**, Division of Global Migration & Quarantine, US CDC
- **Saber Yezil**, WHO/MoH, Saudi Arabia
- **Thuy Bich Hoang**, Viet Nam, Wildlife Conservation Society
- **Christine Kreuder Johnson**, University of California, USA Davis/Nepal context
- **Evelyn Wesangula**, Global Antibiotic Resistance Partnership-Kenya
- **Kamran Khan**, Associate Professor, Department of Medicine, Division of Infectious Diseases, University of Toronto, Canada
- **Olaniran Alabi**, Nigeria Chief Veterinary Officer

Note: All speakers to be confirmed

PARALLEL SESSION 2.5 (PS2.5)

Reducing the Gap: Addressing Neglected Disease; Neglected Populations

Background

Preventable, endemic diseases are rarely prioritized for surveillance as they do not pose a risk of epidemic or pandemic outbreak. This is a failing on two levels: (1) the presence of preventable diseases acts an indicator of the overall state of the health system; and (2) the knowledge of 'usual' allows for detection of the unusual. Strengthening surveillance and other systems for endemic diseases, infectious or otherwise, provides necessary infrastructure to combat the existing and target the emerging. In addition, most of these subsisting populations live in close proximity with their animals and experience a double burden, disease in their animals and disease in their families and communities. A pro-poor initiative on a massive scale, control of NTDs has much to offer in terms of what can be adapted, innovated and built in low-resource settings most burdened by NTDs in an agenda that makes poverty alleviation its overarching objective and aims to leave no one behind.

The success celebrated for some of the NTDs shows that it is possible to build private-public partnerships that lead to concrete results, such as the Global Partners' Meeting on NTDs based on the theme "Collaborate. Accelerate. Eliminate". This encapsulates an exemplary informal collaboration that marks a 'turning point' in global efforts to control and eliminate poverty-related diseases.

The discussion will center on forging cross-sectoral partnerships to tackle NTDs and "diseases of poverty", and will include a range of elements crucial to an effective collaboration across sectors such as financing, research and development, production and delivery of vaccinations and treatment, disease surveillance, role of local communities and other actors on the field. It will elucidate the incentives of building effective cross-sectoral and public-private partnerships by using the case of NTDs. Lessons may be derived from the NTD experience to other areas requiring cross-sectoral partnerships in health where a population-based intervention is appropriate.

Objectives

Marginalized and neglected populations bear the epidemic risk of infectious diseases especially neglected tropical diseases. They are more exposed to disease vectors as well as have less access to effective and timely health care. Without addressing prevention, detection and response among this segment of the population, the world cannot be safe from infectious disease. This session aims to discuss successful examples of cross-sectoral partnerships across human and animal health sectors to tackle "diseases of poverty" including financing, vaccine development, and distribution as well as delivery. It will also address how to target this neglected segment of the population against the threat of infectious diseases. Intervention based approaches through specific diseases can be discussed as well as tackling access and inclusion into the health system through a social determinants approach. Tackling NTDs is addressing the causes of poverty and the pathways to reach the poorest and most vulnerable in society those that will have slower access to universal health coverage and would be a pathway to strengthen health systems, human, animal and environmental.

Moderator

- Dan Normandeau (TBC)

Panelists

- Mark Bradley, Director Global De-worming , Global Health Programs, GSK
  Or, Klaus Brill, Vice President Corporate Commercial Relations, Bayer Pharmaceuticals
  Or, Alasdair King, Director, Intergovernmental Veterinary Health Merck Animal Health
- Dr Nwankwo Uzoma, Senior Medical Officer and Health Economist, Ministry of Health, Nigeria
- Dr Amila Gunesekera, MD, Medical Officer in charge Rabies treatment National Hospital of Sri Lanka
- Harena Rasamoelina, Veterinary epidemiologist, Indian Ocean Commission
- Representative from local NGO involved in distribution and delivery of vaccines/treatment (TBC)
- Representative from WHO or UN system (TBC)
- Representative from CEPI co-founders or Board (TBC)

Note: All speakers to be confirmed

PARALLEL SESSION 3.1 (PS3.1)

To be updated

Note: All speakers to be confirmed

PARALLEL SESSION 3.2 (PS3.2)

Lessons Learned from a One Health Approach to AMR

Background

Antimicrobial resistance (AMR) is a major threat to global health, the world economy, food safety and food security, and therefore poses a unique challenge to humanity. All countries – regardless of their economic situation, the strength of their health systems or their level of antibiotic consumption – will face disastrous consequences if the spread of AMR is not contained. Global and community solutions are needed to prevent overuse of antibiotics, including development of new vaccines, improved diagnostic tests and, above all, universal access to antibiotics which are affordable and effective against drug-resistant diseases. Antimicrobials also play a significant role in both plant and animal health, and therefore, in global food production. While the important goal of reducing antibiotic usage for growth promotion in animals is increasingly implemented, antibiotics will be needed in maintaining the health of food-producing animals, and the safety of their products.

AMR occurs when disease-causing pathogens (including bacteria, fungi, parasites, or viruses) develop defense mechanisms against the drugs designed to treat them, making these resistant pathogens difficult or even impossible to treat. This resistance is the inevitable result of antimicrobial use and an example of natural selection in practice. The more antimicrobials are used, the less effective they become. Rising levels of AMR are a sign that natural selection is taking place more rapidly than innovation in developing new antimicrobials. If this process is to be reversed, the world must innovate more, but also slow natural selection – by eliminating excess use of all antimicrobials; only using second- and third-level treatments when absolutely necessary; and ensuring appropriate access to treatments.

The importance for countries to develop and implement one health focused national action plans

In line with the Global Action Plan on Antimicrobial Resistance, developed by WHO with participation and endorsement by the OIE and FAO, the development of countries' own National Action Plans (NAPs) on AMR is an essential first step towards establishment of an effective response to combat AMR. At the Sixty-eighth WHA in 2015, Member States committed to have NAPs in place by May 2017. Also in 2015, the OIE World Assembly of Delegates adopted Resolution No 26, committing to development of NAPs in the spirit of "One Health", taking into account the use of antimicrobial in animals and ensuring collaboration with public health officials. In February 2016, WHO, in collaboration with FAO and OIE, developed a manual for developing NAPs on AMR and a set of accompanying tools. The three organizations have been working closely with stakeholders to provide technical support to countries for the effective development of their NAPs.

Sharing Expertise for a Coordinated AMR Response

Ensuring political commitment, engagement and support has been a challenge as understanding of AMR, multisectoral collaboration and the importance of developing and implementing NAPs is still somewhat limited. The identification of best practices in human, animal and plant health continues to play an important role as the world is still learning what works best in particular contexts. WHO is sharing expertise regarding human health and developing communities of practice to support countries with ongoing efforts. Inter-sectoral action, and the complexity of coordination within and across sectors, continues to be a challenge, particularly as countries shift towards NAP implementation.

Global Action Plan for Antimicrobial Resistance

At the Sixty-Eighth World Health Assembly in May 2015, WHO Member States endorsed a global action plan through resolution WHA68.7 to tackle antimicrobial resistance, including antibiotic resistance, the most urgent drug resistance trend.
The AMR global action plan contains five major strategic objectives:

1. to improve awareness and understanding of antimicrobial resistance;
2. to strengthen knowledge through surveillance and research;
3. to reduce the incidence of infection;
4. to optimize the use of antimicrobial agents; and
5. to develop the economic case for sustainable investment that takes account of the needs of all countries, and increase investment in new medicines, diagnostic tools, vaccines and other interventions.

The global action plan, which takes into account the commitment, perspectives and roles of all relevant stakeholders is a plan in which everyone has clear and shared ownership and responsibilities. The endorsement of the plan reflects a global consensus that AMR poses a profound threat to human health.

One Health Approach
Addressing the rising threat of AMR requires a holistic and multisectoral ("One Health") approach because antimicrobials used to treat various infectious diseases in animals may be the same as or similar to those used in humans. Resistant bacteria arising in humans, animals, plants or the environment may spread from one to the other, and from one country to another. One Health recognizes that the health of humans, animals and ecosystems are interconnected. It involves applying a coordinated, collaborative, multidisciplinary and cross-sectoral approach.

The WHO, FAO and OIE speak with one voice and take collective action to minimize the emergence and spread of AMR. The aim is to:

- Ensure that antimicrobial agents continue to be effective and useful to cure diseases in humans and animals;
- Promote prudent and responsible use of antimicrobial agents;
- Ensure global access to medicines of good quality.

Objectives

- To gain a better understanding of how the world can learn from the past 2.5 years of AMR response since the Global Action Plan as we shift from development of AMR strategies towards implementation
- To identify main challenges and successes in implementing national action plans and determine ways to productively more forward

Moderator

- **Martha Gyansa-Lutterodt**, Chief Pharmacist of Ghana, IACG Member

Panelists

- WHO
  - **Marc Sprenger**, Director of AMR Secretariat, WHO
- FAO
  - **Juan Lubroth**, Chief Veterinary Officer, FAO
- OIE
  - **Matthew Stone**, Deputy Director General, OIE
- Professional association – health

  - **Judith Shamian,** President, International Council of Nurses
- Professional association – agriculture
  - **Marco Marzano de Marnis**, Secretary General, World Farmers Association

Note: All speakers to be confirmed

PARALLEL SESSION 3.3 (PS3.3)

Climate Change and Emerging Diseases: The Importance of Resilient Societies

Background

During the long processes of human cultural evolution, population dispersal, and subsequent inter-population contact and conflict, several distinct transitions in human ecology and inter-population interactions have changed profoundly the patterns of infectious disease in human populations. As we move further into the 21st century, the spread and increased lability of infectious diseases, new and old, reflects the impacts of demographic, environmental, technological and other rapid changes in human ecology. Climate change, one of the global environmental changes under way, is anticipated to have a wide range of increased impacts upon the occurrence of infectious diseases affecting human, animal, and plant populations.

Climate and weather patterns affect the distribution and risk of many infectious diseases, including vector-borne diseases such as malaria, Rift Valley fever, plague, encephalitis and dengue fever. Weather patterns also affect the distribution of food- and water-borne diseases and emerging infectious diseases such as West Nile virus, Hantavirus, and Ebola hemorrhagic fever and the sporulation of diseases such as anthrax and other clostridia.

The effect of climate variability on infectious diseases is determined largely by the unique transmission cycle of each pathogen. Transmission cycles that require a vector or non-human host are more susceptible to external environmental influences than those diseases which include only the pathogen and human. Important environmental factors include temperature, altitude, precipitation and humidity. Several possible transmission components include pathogen nature (viral, bacterial, etc.), vector (mosquito, snail, etc.), abiotic physical vehicle (water, soil, etc.), non-human reservoir (mice, deer, etc.), and human host.

Humans are more than passive recipients of climate change-induced health effects. We can play a significant and active role through proactive adaptation and mitigation measures in order to control and alleviate the negative health impacts of climate change. The magnitude of changes in climate variables varies across the globe, posing more challenges and stresses for some groups, societies and populations than others. Given the same magnitude of climate change, some population groups and areas are more vulnerable to the elevated risks due to their lack of the ability and resources to effectively respond to the stresses and challenges, including nutrition, immune status, and access to goods, services, and clean water. Inadequate public policies may be perpetuating the marginalization that increases vulnerability to adverse events or change processes. Given that infectious diseases do not confine themselves within a vulnerable population group, these diseases pose a shared global risk and require a coordinated global effort to reduce their vulnerability to climate change-induced health risks. Importantly, human vulnerability to the changing risks for infectious diseases driven by climate change may be altered through proper adaptation measures. Examples include the continuous evolution of public health programmes, the cyclical re-allocation of financial and health care resources and the pre-emptive alteration of policies following scientific projection of spatial–temporal changes in health risk for human infectious diseases. Early warning systems based on such projections have been proven effective in helping societies take proactive measures to prevent or alleviate the possible health impacts.

Objectives

- Explore projected trends in climate change over the 21st century, and their expected impact on infectious disease emergence/re-emergence and AMR
- Highlight practical, evidence-driven policy and approaches to defining and mitigating human-driven emerging disease risk

Moderator

- **Pradeep Kurukulasuriya**, GEF/GCF, UNDP Bangkok

Panelists

- **Sander Koenraadt**, Wageningen University, Netherlands. Climate change and vector-borne diseases; climate change effects on highland malaria, arboviruses.
- Two panelists from government /NGO partners involved in GEF projects on Strengthening national capacities for health and climate change adaptation. Selected speakers to represent case studies from Nepal **Meghnath Dhimal** (Consultant on leave from MOH) and Bangladesh **Iqbal Kabir** (MOH)
- **Montira J. Pongsiri** PhD, MPH, Senior Research Associate, Planetary Health Science Policy, Cornell University, College of Veterinary Medicine, Dept. of Population Medicine and Diagnostic Sciences
- **Kristie Ebi**, Professor, visiting at Department of Public Health and Clinical Medicine Occupational Medicine, Umea University.

PARALLEL SESSION 3.4 (PS3.4)

To be updated

Note: All speakers to be confirmed

PARALLEL SESSION 3.5 (PS3.5)

Policy Coherence: Effective Partnerships for Global Health

Background

The 2030 Agenda for Sustainable Development set ambitious health-related targets to "ensure healthy lives and promote well-being for all at all ages" and "strengthen the means of implementation and revitalise the Global Partnerships for Sustainable Development". To this end, for example, the epidemics of AIDS, tuberculosis, malaria and neglected tropical diseases, as well as effectively addressing the threat of emerging infectious zoonotic diseases will require substantial policy coherence and investments. These are critical for the needed health innovations, as well as the development of systems-wide capacities within countries for the necessary measures of "prevention, detection and response".

While many global efforts have focused on increasing research and development for new health innovations, it is also now clear that there must be a corresponding emphasis on strengthening systems and capacities to deliver the range of needed health services and products. The Ebola outbreak in West Africa was an important reminder of the importance of effective, and continuing, core government functions, within and beyond the health sector. As the global community contemplates responses to address epidemics and infectious diseases, the imperatives for ensuring an integrated approach are clear: effective partnerships are required between the public, private and the community sectors.

This signals a clear need for increased policy coherence, which demands coordination between a broad range of actors; not just between government agencies, private sector and community actors at the national and local levels, but also between those working at the global level, including on innovation, R&D, financing, governance and management. Addressing interconnected elements, and encouraging effective synergies of efforts of stakeholders in the public, private and community sectors, will be critical, not only in effectively addressing infectious and new emerging diseases, but also in helping low- and middle-income countries (LMICs) achieve universal health coverage (UHC) and other health-related targets.

Objectives

In this context, the session aims to stimulate a dialogue between key stakeholders with the aim of identifying how public-private-community partnerships (PPCs) can address the needs of LMICs for effective "prevention, detection and response" to the threat of infectious diseases. The aim is to generate recommendations and proposals that can promote effective policy coherence and public-private-community partnerships at all levels. It is proposed that the discussions focus on three key, inter-related elements, as follows:

Policy coherence

- How can cross sectoral, multidisciplinary approaches at the national, regional and global levels be effected and prioritised?
- Which are key factors in facilitating policy, operational delivery environment and effectiveness for such approaches?
- What are relevant experiences and lessons learnt from existing projects and initiatives?
- What are the means to promote adoption of evidenced-based best practices and transferable lessons learned for policy coherence, including South-South approaches and strategies?

Effective partnerships

- What can we learn from existing PPC partnerships in terms of their contribution to the prevention, detection and response to infectious diseases?
- Are there experiences outside the health arena that are transferable?
- How can such partnerships be further strengthened?
- What are the right incentives for collaboration at different levels?
- What are the key considerations for ensuring the sustainability of PPC partnerships?

Evaluation and measuring success

- How can evaluation of PPC partnerships be undertaken?
- How do we measure success; e.g., what should be the matrix of success and effectiveness?
- Can there be evidence-based assessments of investments in innovation and R&D? And their eventual delivery in countries, including best practice, data and knowledge sharing?

Moderator

- **Tenu Avafia**, Team Leader, HIV, Health and Development Team, UNDP

Speakers

- **Mandeep Dhaliwal**, Director of HIV, Health and Development Team, UNDP
- **Hayato Urabe**, Director of Investment Strategy & Management, Global Health Innovative Technology (GHIT) Fund
- **Chalermsak Kittitrakul**, AIDS Access Thailand

Panelists

- **Yodi Mahendradhata**, Director, Center for Health Policy and Management, Universitas Gadjah Mada, Indonesia
- **Mwele Ntuli Malecela**, Director, WHO Regional Office for Africa
- **Richard Kock**, Professor of Wildlife Health and Emerging Diseases at the Royal Veterinary College, University of London, UK
- **Osman Dar**, Project Director, One Health Project, Centre on Global Health Security, London

Note: All speakers to be confirmed

PARALLEL SESSION 4.1 (PS4.1)

Moving Forward and Outward: Progress in Implementation of Global Frameworks and Initiatives

Background

Historically, international organizations, academia and others have provided regulations, standards or guidance to the global community (e.g., International Health Regulations, OIE Terrestrial Animal Health Code, and Codex Alimentarius). However, the challenge at all levels (i.e., globally, regionally, nationally and locally) has been in the actual implementation of these regulations, standards or guidance with the available resources and existing infrastructures. In response to requests from national authorities and as a result of breakdowns or delays in global, regional, national and local responses to emergent diseases, the global community has moved forward to develop frameworks and advance initiatives that further support national and local authorities in their efforts to prevent, detect and respond to human, animal and environmental health concerns. Critical to the utility and effectiveness of these frameworks and initiatives is the ability to build synergy among multiple stakeholder efforts and to address the needs of individual countries and communities.

Objectives

- To present a selection of global frameworks and initiatives, discuss the challenges and successes in their implementation and draw lessons to build sustainable, inclusive and effective preparedness and response systems.
- To discuss how these different global frameworks may (or may not) build upon each other or provide opportunities for synergies in supporting national and local capacity building efforts.

Moderator

- **Julie R. Sinclair**, CDC One Health Liaison to the OIE
- **Ronello C. Abila**, OIE SubRegional Representative for Southeast Asia

Panelists

- Development and implementation of the WHO's Joint External Evaluation (JEE) and role in implementation of the International Health Regulations and building national capacity (Mozambique as case study) – **Ali Ahmed Yahaya**, WHO
- OIE Performance of Veterinary Services (PVS) Missions and future course – **John Stratton**, OIE
- WHO Research and Development Blueprint – **Young-Mee YEE**, member of Advisory Group National of Health, Korea Centers for Disease Control and Prevention
- Global Rabies Initiative business plan – **Bernadette Abela-Ridder**, WHO

Note: All speakers to be confirmed

PARALLEL SESSION 4.2 (PS4.2)

Multi-sectoral Partnerships for Action on AMR

Background

Antimicrobial Resistance (AMR) respects no borders and has become an increasing threat to all countries - developed and developing alike. Common infections become untreatable, devastating infectious diseases become much more difficult to contain and standard medical procedures become a challenge. Thus, AMR has a major negative impact on growth and global economic stability. Given the breadth of impact from AMR, the only effective means to address AMR sustainably is through multisectoral action and partnership; however, challenges have been identified as to how stakeholders from different sectors can meaningfully come together to produce action and change. Innovative new approaches are needed to truly harness the potential of all people and perspectives, particularly those most vulnerable.

The UN Sustainable Development Goals (SDGs) recognize the importance of AMR (paragraph 26 of the Declaration). The attainment of many of them will depend on the availability of and access to affordable and effective antimicrobial medicines and other technologies such as diagnostic tests. AMR seriously threatens the health and lives of vulnerable populations, such as newborns, children, and women, as well as sustainable food and agriculture production and a healthy environment. AMR is reducing our ability to protect the health of animals and therefore is threatening safe and sustainable food and agriculture.

In a tripartite approach, WHO, the Food and Agriculture Organization (FAO) and the World Organization for Animal Health (OIE) recognize that addressing health risks at the human–animal-plant-ecosystems interfaces requires strong partnerships among entities that may have different perspectives and much work is currently ongoing.

On 21 September 2016, the President of the UN General Assembly convened a one-day high-level meeting at the UN Headquarters on AMR with the participation of Member States, non-governmental organizations, representatives of civil society, the private sector and academic institutions. The primary objective of the meeting was to summon and maintain strong national, regional and international political commitment in addressing AMR and the meeting emphasized the important role and responsibilities of governments, as well as the roles of non-State actors, the private sector and relevant inter-governmental organizations, particularly the WHO, FAO and OIE in establishing, implementing and sustaining a cooperative global, multi-sectoral and cross-sectoral approach.

Objectives

- How can the world come together to meaningfully and effectively address AMR in a sustainable way and in particular, engage non-traditional partners?
- Multisectoral partnerships have been identified as essential for addressing AMR – how can the world now move from planning to action at both the international and local levels?
- How does addressing AMR contribute to the attainment of the SDG's? How to effectively engage all relevant sectors: environment, food, employment, poverty reduction, agriculture, development partners, academia, private sector, etc.?
- How can the voice of all people be heard, particularly those marginalized and most vulnerable?
- What are the issues and opportunities around ensuring linkage between global and community/country-level partnerships? How can partnerships focus on possibilities for

meaningful collaboration, action on the ground and specific problems affecting communities rather than focusing only on the broader policy levels?

- What are some good practices and lessons learned from past multisectoral collaborations that could be applied to collaborations on AMR?

Moderator

- **Matthew Stone**, Deputy Director General, OIE

Panelists

- Civil society representative
  Arturo Quizhpe Peralta, Head, ReAct Latin America and Dean of the Faculty of Medical Science at University of Cuenca, Ecuador
  Stefano Nobile, Focal Point for Health, Caritas International, Vatican City
- Stakeholder perspective
  Maria Lettini, Director, FAIRR
- Country representative
  Ana Marie Garfin, National TB Control Program Manager, Department of Health, Phillippines
- WHO
  Marc Sprenger, Director of AMR Secretariat, WHO
- Representative from the interagency coordination group
  Jaana Husu-Kallio, Member of IACG, Permanent Secretary, Ministry of Agriculture and Forestry, Finland

Note: All speakers to be confirmed

PARALLEL SESSION 4.3 (PS4.3)

Community Systems: the Bedrock of Responses to EID and AMR

Background

Community preparedness and response to emerging infectious diseases (EID) and antimicrobial Resistance (AMR) is critical to the health outcomes of individuals. In HIV, people both living with and affected by HIV have been at the forefront of providing treatment preparedness to promote health-seeking behavior, improve adherence and other health outcomes, whilst advocating for increased availability, accessibility and uptake of key viral load diagnostics as well as 2nd and 3rd line antiretroviral therapy. In Malaria, civil societies work with other stakeholders to address artemisinin resistance in Southeast Asia via educating communities about the hazards of substandard drugs and organizing public awareness campaigns to complete a 3-day treatment course and on measures to prevent further spread of resistant pathogen strains. Similarly in tuberculosis, community-based outpatient treatment of MDR-TB in resource poor settings yield higher cure rates and facilitated better referrals to other health services required by TB affected communities. Furthermore, lessons learned from the early response to Ebola in West Africa have recognised the problem of sidelining community engagement as a key factor contributing to failure of the early emergency health programs to meet the needs and realities confronting affected populations in the region.

Today, prevention, detection and response to EID relies significantly on an effective surveillance system which starts at the community level with effective mechanisms in place to ensure linkage into national level health systems reporting. The Ebola crisis highlights the importance of integrated community case management (iCCM) and the roles of the network of community health workers and community leaders in early and better case reporting, contact tracing and bringing people into care, whilst reducing stigma and discrimination associated with the virus. Community-based control and preventive behaviours for vector control is recognized as a key pillar in disease response and preparedness for Zika and other mosquito-borne diseases. The use of innovative technologies in the response to EID by communities and community health workers contributed to the prompt control of the outbreak by providing a valuable platform for early warning and guiding early actions.

Objectives

The session aims to explore community roles in preparedness and response to EID and AMR, concentrating on lessons and approaches deployed in disease-specific programs, such as HIV, TB, Malaria, Ebola and Zika, whilst underscoring the importance of focusing on people, i.e. ensuring that systems for health involve the affected community and promotes community action as part of the overall health system critical for identifying, reporting and responding to emergency health threats.

The session is designed to generate discussions on commonalties and contexts of community action, and to reflect on emerging challenges that still persist in response to EID and AMR from the community perspectives, as well as to identify practical solutions drawing the lessons learned from community responses to the epidemics of HIV, TB, Malaria and to the most recent outbreaks of Ebola and Zika across the globe.

Moderator

- **RD Marte**, Asia Pacific Coalition of AIDS Service Organizations or Alessandra Nilo of GESTOS

Panelists

- **Othman Mellouk**, International Treatment Preparedness Coalition, HIV treatment advocate and educator, Morocco
- **Lina Kharn**, ARC Cambodia, Malaria Consortia, Cambodia
- **Anton Basenko**, Eastern Europe and Central Asia Network of People who Inject Drugs (ENPUD), Ukraine
- **Bhargavi Rao**, MSF-Holland, U.K
- **Alessandra Nilo**, GESTOS, Brazil
- **Abdulai Sesay**, Civil Society Movement Against Tuberculosis, Sierra Leone
- **Kannikar Kijtiwatchakul**, NHS Board member, Thailand

Note: All speakers to be confirmed

PARALLEL SESSION 4.4 (PS4.4)

Finding the Win-Win Solutions for Better Health from Better Food Systems

Background

The surging global demand for animal source foods and rapid growth rates in livestock and aquaculture production are being met with a range of approaches including both aggressive consolidations of production and marketing chains into intensive, large-scale commercial operations, as well as expansion of extensive, small- and medium-scale production systems. Most current approaches contain inherent vulnerabilities. How can the present food systems be reconfigured to feed the growing human population without leading to unintended health consequences for people, animals and the ecosystem? All the stakeholders in these food systems from production, marketing and consumption need to be actively involved in developing coherent and comprehensive approaches where almost everyone can benefit—i.e. collaborative win-win solutions.

Objectives

- Build upon the existing evidence base for the broad collateral benefits realized when longer term investments in shifting production toward reduced impact practices is achieved
- Review cases from the field of how these production shifts were achieved, the methodologies used in measuring the impact realized, and how the impacts were translated into advocacy efforts influencing policy and decision making
- Identify strategies for scaling up these approaches involving the critical stakeholders in a broad range of food systems based on animal production contexts

Moderator

- **Peter Black**, United Nations Food and Agriculture Organization

Speakers

- Farming organization representative representing small/medium size producers: **Andrey Susanto**, Indonesia
- Large producer: **Randal Giroux**, Cargill
- Consumer organization representative: **Niyada Kiatying-Angsulee**, Thailand
- Pharmaceutical industry representative: Elanco, **Kerry Keffaber**, Chief Veterinarian, Scientific Affairs and Policy.
- Knowledgeable Food Systems expert: **Robyn Alders**, University of Sydney, Australia.

Note: All speakers to be confirmed

PARALLEL SESSION 4.5 (PS4.5)

Bringing Solutions into Focus: Harnessing the Power of an Economic Lens

Background

Beyond the tragic loss of human life, the economic impact attributable to epidemics and pandemics can be catastrophic. SARS, $30 billion; Pandemic H1N1: $40 billion; Ebola: $2.8 billion in the three West African economies alone. Recent estimates place the inclusive costs from a moderately severe influenza pandemic at $570 billion annually, within the range projected for the annual cost associated with global climate change.[7] And, without intervention, the cumulative economic impact from anti-microbial resistance (AMR) through 2050 is projected to exceed $100 trillion (two-thirds of which is in low- and middle-income countries), substantially more than current annual global economic output.[8]

Despite a repeated pattern of costly response, the economic case for investing in proactive, preventive measures targeting a reduction in the pressures that facilitate disease emergence has not been widely adopted. A yearly investment of $1.9-3.4 billion to strengthen animal and human public health systems would yield a global public benefit estimated at over $30 billion annually through avoided economic damages associated with pandemics.[9] High return on investment is expected even if only a portion of pandemics are prevented, and strengthened One Health capacity in countries may confer additional benefits via improved prevention and control of endemic disease and AMR. However, challenges in mobilizing capital; an anemic evidence base and difficulty in translating evidence into policy advocacy with budget decision-makers; competing priorities for scarce health systems funding; and inequitable distribution of costs and benefits across sectors and stakeholders are all amongst the impediments to adopting the economic case for investing in preventive approaches.

Recent efforts designed to address these challenges have employed a range of approaches. Structures prioritizing risk avoidance and transference are being developed (e.g. multi-sectoral health security planning and capacity investments; epidemic/pandemic insurance structures). Also underway are new models capturing the economic impact of disease emergence as a function of land use, which will enable the disease regulatory role of ecosystems to be fairly valued and incorporated into payment for environmental services frameworks. And global financing structures promoting targeted, multi-sectoral systems strengthening and incentivizing investments in preparedness are being established.

[8] O'Neill. Antimicrobial Resistance: Tackling a crisis for the health and wealth of nations. Review on Anti-Microbial Resistance. February 2015

[9] World Bank. People, Pathogens and Our Planet: Economics of One Health. 2012.

Objectives

- Highlight successful practices and approaches that have demonstrated promise in fostering decision making informed by economic analyses;
- Profile structures with proven utility in transcending the identified challenges, including resource prioritization and inequitable sectoral cost and benefit distribution;
- Discuss approaches that strengthen the economic evidence base for investments in proactive, preventive disease mitigation approaches; and
- Review policy and regulatory options, such as tax and incentive structures, that can contribute to a favorable investment environment for more wide scale adoption of risk mitigation approaches

Moderator

- **Dan Schar**, Regional Emerging Infectious Disease Advisor, USAID Regional Office

Panelists

- **Gavin Yamey**, Duke University Global Health Institute
  Introduction/overview; making the investment case for a preventive, One Health approach; challenges and opportunities in financing preparedness
- **Ramanan Laxminarayan**, The Center for Disease Dynamics, Economics, & Policy
  Global consumption of antimicrobials in animal production, costing antimicrobial growth promoter phase out, and catalyzing fit-for-purpose, enforceable AMU policies
- **Carlos Zambrana-Torrelio**, EcoHealth Alliance (A328)
  Analyzing the economics of disease emergence from deforestation to support better practices in the extractive industries and reduce pandemic risk

Subject: BPERNet Update and Meeting Date
Attachment(s): "PMAC2018 Provisional Conference Program_as of Oct 27.pdf"

Dear BPERNet Steering Committee Members,

After careful consideration of the size and scope of PENAPH and increased travel and schedule concerns from BPERNet members, CBEP has decided to move the date of our second meeting to coordinate with the Prince Mahidol Award Conference (PMAC) 2018 in Bangkok, Thailand. We will hold our meeting on Wednesday, 31 January. We have yet to set a time or location, but anticipate that travel planning should support a full day meeting.

Most of PMAC's objectives are focused on zoonoses and some complement BPERNet's ecological focus, this will assist members of the group who plan to attend the conference and use it as an opportunity to advertise our network. I am attaching PMAC information for everyone's situational awareness.
Please consider this email an official a save the date on behalf of CBEP, with more information to follow, which will include travel, agenda, time, and location information. At your earliest convenience, please let me know if you can support attending this meeting.

Thanks!

V/r,

Katie Leahy

PRINCE MAHIDOL AWARD CONFERENCE 2018

Making the World Safe from the Threats of Emerging Infectious Diseases

Background

The Prince Mahidol Award Conference (PMAC) is an annual international conference focusing on policy-related health issues. The Prince Mahidol Award Conference 2018 is co-hosted by the Prince Mahidol Award Foundation, the Thai Ministry of Public Health, Mahidol University, the World Health Organization, The World Bank, U.S Agency for International Development, Japan International Cooperation Agency, The Rockefeller Foundation, with support from other key related partners. The Conference will be held in Bangkok, Thailand, from 29 January – 3 February 2018. The theme for PMAC 2018 is "Making the World Safe from the Threats of Emerging Infectious Diseases".

We live in an era when the emergence of novel infectious disease agents is posing an increasing threat to global health and security. The threat from novel infectious diseases is accelerating at a pace and with an intensity unprecedented in human history, driven by increasing human populations, climate change and surging global travel. The possibility that a single lethal microbe could suddenly emerge and sweep through every household, through every community without regard to national borders or social and economic standing is a shared fear across the globe. Just the fear can cost billions, as illustrated by recent Ebola and Zika virus panics in little-affected countries. But the reality of the threat is all too clear, proven by the decades of response to the HIV-AIDS pandemic. Yet the world is not prepared to either mitigate the impact of an emergent disease threat or prevent its emergence.

Zoonotic and AMR related diseases account for more than 95% of all emerging infectious diseases reported during the second half of the 20th century[1]. In this century the emergence of SARS, pandemic influenza, MERS, and the spread of Ebola and Zika reflect the world's increasing vulnerability to novel zoonotic threats. The simultaneous emergence of pathogens resistant to antibiotic therapies raises the prospect of a "post antibiotic" world. While the drivers underlying the emergence of zoonotic and antibiotic resistant diseases are complex, human behaviours and their impact on animal populations and the environment are understood to be central to the emergence of both disease threats. The role of increasing animal-human contact in the emergence of zoonotic diseases has been well documented and been increasingly the focus of One Health initiatives across the globe. The contribution made by the inappropriate use of antibiotics in animal husbandry to AMR is less well documented but in recent years has been increasingly understood to be a core driver behind the emergence and global spread of antibiotic resistant organisms, along with inappropriate "prescriber-user" practices associated with antibiotic use in clinical care. Changing environmental and climatic conditions have also been closely linked to the emergence of novel infectious diseases. That infectious disease emergence is closely associated with practices and

[1] K. E. Jones *et al.*, Global trends in emerging infectious diseases. *Nature* **451**, 990-993 (2008).

behaviours at the animal-human-environment interface speak to the importance of an expanded multi-sectoral alliance across the animal, human and environmental sectors to address the threats posed by both zoonosis and AMR. The Global Health Security Agenda and related One Health movement provide important frameworks for mobilizing international action.

The Rising Threat of Zoonotic Diseases

Since the Influenza Pandemic of 1918 when between 50-100 million died (5-10% of the human population) we have been fully aware of how vulnerable our place on this planet is.

Even in the absence of significant global mortality, epidemics and pandemics can cost tens of billions of dollars, reversing development gains and pushing communities and households into poverty. The SARS outbreak in 2003 cost the economies of East Asia between $30-50 billion and estimates of the global economic cost of an influenza pandemic range from $374 billion, for a mild pandemic, to $7.3 trillion, for a severe pandemic - with a 12.6% loss of gross domestic product.

Strategically, policies to address a potential pandemic threat are constrained by an unresolved debate over the use of adaptive measures - that aim through the use of technological measures to reduce the impact of diseases after they have emerged vs mitigation measures - that focus on the underlying causes of disease emergence. The adaptive tools we traditionally rely on to protect us from the world of infectious diseases – vaccine and therapeutics – too often are shown ineffective against a novel threat; and, the timely development and deployment of new and effective biomedical countermeasures is undercut by the speed at which the threat spreads.

Similarly, our ability to mitigate the emergence of new threats is undermined by a lack of knowledge about the viral ecology and the drivers, including human behaviors, which propel the emergence of a new threat. It is at these moments we realize just how few our adaptive and mitigation options are – and how vulnerable the global community is. After each episode the world admonishes itself for being ill prepared to deal with a global threat – but after decades of largely reacting adaptively to each event, with only a tangential focus on mitigation, we are only marginally better able to deal with the next one.

A “Post Antibiotic World”

The development and commercialization of antimicrobials stands as a defining achievement of 20th century medical practice. Antimicrobials heralded an era of expanded life expectancy, paved the way for advanced medical and surgical treatments, improved animal health and welfare, and made possible curative therapy for once fatal infections. Decades of superfluous and inattentive use of antimicrobials across the human and animal health sectors now threaten these advancements. The pace of reported treatment failures and antimicrobial resistance (AMR) in common pathogens is increasing, with multi-drug resistant pathogens creating the prospect of a ‘post antibiotic’ world. In the absence of interventions, AMR-associated human mortality is projected to soar from a current rate of 700 000 to over 10 million annually by 2050—as readily treatable infections become life threatening, and routine procedures are rendered unsafe.[2] Asia is expected to account for half of this projected global mortality. The impact of AMR on morbidity and mortality is matched by a substantial economic burden, with resistance linked to aggregate losses anticipated to exceed USD 100 trillion by 2050.

[2] O’Neill, J. Review on Antimicrobial Resistance. Tackling a Global Health Crisis: Initial Steps. 2015

Antimicrobial resistance is exacerbated by the unregulated use of antimicrobials across both the human health and animal health sectors. A particular concern is the shared use of same classes of antibiotics in humans and in animals, potentially exacerbating the selection pressures on pathogen populations in animals and humans that encourage the development of resistance and exchange of resistance genes. By example, in the United States the livestock production industry accounts for 80% of the total use of antibiotics used for treatment of human infections.

Antimicrobial resistance is one of the three flagship topics for the tripartite (FAO, OIE and WHO) collaboration. At the Sixty-eight World Health Assembly in May 2015, the World Health Assembly endorsed the Global Action Plan (GAP)[3] on AMR and requested to strengthen the tripartite collaboration between FAO, OIE and WHO for combating antimicrobial resistance in the spirit of the "One Health" approach. The Global Action Plan, which ensured a One Health approach and consistency with Codex Alimentarius and OIE inter-governmental standards and guidelines, aims to ensure continuity of successful treatment and prevention of infectious diseases with effective and safe medicines that are quality-assured, used in a responsible way, and accessible to all who need them. Guided by this global action plan, the Member States, the Secretariat, and their international and national partners aim to: (1) improve awareness and understanding of antimicrobial resistance; (2) strengthen knowledge through surveillance and research; (3) reduce the incidence of infection; (4) optimize the use of antimicrobial agents; and (5) develop the economic case for sustainable investment that takes account of the needs of all countries, and increase investment in new medicines, diagnostic tools, vaccines and other interventions.

A high level meeting on anti-microbial resistance was held in September 2016 at the United Nations General Assembly, generating a statement of global commitment to address AMR through a multi-disciplinary approach.[4]

PMAC 2018 Will Be Action Focused. Protecting the world from the threat of zoonotic diseases and ensuring effective stewardship of antibiotics requires a common and well-coordinated multi-sectoral effort. While there has been significant progress in building multi-sectoral One Health action against zoonotic diseases, AMR efforts remain highly siloed with an unequal focus on the respective contributions made by the inappropriate use of antibiotics in clinical care and animal production, as well as limited opportunities for bringing human, animal and environmental health sectors together to forge a common strategy. There is an urgent need to bring a comprehensive One Health risk mitigation approach to address zoonotic and AMR related diseases that addresses the direct consequences of animal-human interactions and contributory pressures related to environmental and climate changes.

PMAC 2018 will provide an important setting for fostering policy and strategic action by engaging multi-sectoral experts in zoonosis and AMR, as well as climate change and related environmental fields from across the public and private sectors, international organizations, foundations, academics and non-governmental organizations, as well as critical players in Global Health Security Agenda (GHSA). Importantly, a PMAC sponsored "Making the World Safe from the Threats of Emerging Infectious Diseases" would build on PMAC 13's highly successful conference on One Health and lead to real change.

PMAC 2018 Will Build On Past PMAC Themes. Since 2007, the Prince Mahidol Award Conference has been organized as an annual international conference focusing on policy-related public health issues of global significance – including, Universal Health Coverage, Health Equity, Meeting the

[3] Global Action Plan on Antimicrobial Resistance, http://www.who.int/drugresistance/global_action_plan/en/
[4] http://www.un.org/pga/71/2016/09/21/press-release-hl-meeting-on-antimicrobial-resistance/

Needs of Vulnerable Populations, and addressing the threats posed by infectious diseases. Each of these meeting has brought together leading public health leaders and stakeholders from around the world to propose concrete solutions and recommendations. PMAC 2018 will explicitly look to build on the successes of past PMACs and to identify opportunities to further contribute to the systems and capacities required to address the comprehensive health needs of the world's populations

Objectives

1. To accelerate progress in the adoption of multi-sectoral approaches for addressing zoonotic diseases and antimicrobial resistance
2. To advocate for evidence-based priority setting and policy decisions for zoonotic diseases and antimicrobial resistance
3. To share knowledge and experience in addressing the challenges posed by zoonotic diseases and antimicrobial resistance
4. To promote a greater understanding of the range and nature of the "drivers" underlying the emergence of new disease threats and options for their mitigation
5. To highlight emerging demographic, climatic and travel trends to better understand how disease emergence will evolve over the course of this century
6. To underscore the collateral socio-economic and development benefits associated with a One Health Agenda

Sub-themes

Sub-theme 1: Learning from the Past: Towards Effective and Sustainable Policies, Practices and Capacities for "Prevention, Detection and Response" to Emerging Zoonosis and Antimicrobial Resistance

This sub-theme is focused on presenting evidence for how efforts across the globe over the past two decades to address zoonotic and AMR related threats are contributing to more effective policies, practices and capacities for "prevention, detection and response" to EIDs. Given the inherent multi-sectoral aspects of disease emergence this is an opportunity to learn from recent experience with efforts such as the Global Health Security Agenda (GHSA), International Health Regulations, the One Health movement, and other platforms illustrating challenges and solutions for building effective partnerships for addressing zoonosis and AMR.

Issues to be discussed under this sub-theme are:

1. Evidence for optimal policies, regulations and systems for addressing EIDs
    - What we have learned from country, regional and global level experiences in addressing EIDs
        - Case studies illustrating successes and failures; how well do we manage and mitigate present threats (e.g. MERS CoV, Nipah virus, Zika virus, Zoonotic Influenza, Ebola virus, AMR, and others)
        - Organizational options for building sustainable national-level partnerships across multi-ministerial groups, including Health, Agriculture, Environment, Finance and Education
            - What are the policy requirements
            - What are the human resource requirements
            - What are the organization requirements

        - What are resource requirements
    - How are these experiences translated to the sub-national level
        - What are the equivalent requirements for provincial/county level operations

2. Evidence for optimal global and regional level structures for addressing EIDs

- What are the lessons learned on building global and regional level partnerships, including the GHSA, One Health and Planetary Health, to address EIDs
    - How effective have global and regional partnerships been in building multi-sectoral alliances to enable country level actions
        - What are the policy requirements
        - What are the human resource requirements
        - What are the organization requirements
        - What are resource requirements

- What is the evidence for proactive, flexible structures that enhance capacities and preparedness across the prevention-detection-response continuum?
    - What have we learned from the pandemic vaccine development banks; consortia for conservation of antimicrobials?
    - What can we learn from parallel efforts, such as those addressing global climate change and carbon emissions?
    - What examples demonstrate the ability to bridge the apparent dichotomy between capacity building and a research agenda concerning emerging zoonoses and AMR?

3. Evidence of novel, upstream approaches to earlier detection and trends monitoring, including but not limited to:

- Novel surveillance postures and strategies,
- digital diseases detection,
- crowdsourcing big data,
- predictive analytics on disease distribution

4. Evidence for more sustainable approaches for “prevention, detection and response”

- What are examples of sustainable financing structures? What have we learned from:
    - The World Bank Pandemic Emergency Financing Facility?
    - Evolving schemes for engaging insurance companies to “share” pandemic risk?
    - Efforts to quantify cost attributable to zoonotic disease and AMR burden, project pandemic influenza economic impact, and make a credible investment case for prevention and risk mitigation?
- What are examples of “preparedness” activities that address long-term sustainability?
    - What have we learned from the World Bank and WHO’s joint effort to develop strategies for both pandemic and “all hazards” preparedness and related long-term financing schemes?
- Which financing models have proven utility in employing an evidence driven approach to discouraging high risk practices and incentivizing risk mitigation in approaching pandemic prevention as a global public good?

Sub-theme 2: Harnessing the Power of Public-Private-Community (PPC) Partnerships for "Preventing, Detecting, and Responding" to Zoonosis and AMR

This sub-theme is focused on examining the evidence for building effective partnerships that bring together community, private sector and public sector resources for sustainably addressing the threats posed by zoonosis and AMR. As with the previous sub-theme, the inherently multi-sectoral nature of zoonosis and AMR requires active engagement across multiple stakeholders. In addition to the Public sector, Private sector actors who may be directly engaged in activities that inadvertently contribute to "drivers" for EIDs will need to be actively involved in any efforts to better mitigate the consequences of their activities. Similarly, communities are key stakeholders, both as consumers and potential contributors to some of the drivers that underlie disease emergence (e.g. inappropriate use of antibiotics in rearing of livestock and aquaculture)

Issues to be discussed under this sub-theme are:

1. Evidence for strong PPC partnerships that have contributed to "prevention, detection and response" to Zoonosis and AMR

- What are the lessons from PPC partnerships in addressing EIDs
    - Country, regional or global examples of how PPC partnerships have been able to harness across each of the constituencies to address EIDs in ways that greatly enhanced the overall impact
        - What were the incentives for PPC partnerships
        - What were the roles and responsibilities of each group
        - What were the metrics for valuing the PPC partnerships
        - What were the operational factors for sustainability of PPC parntership

2. Evidence of successful outreach and community empowerment
    - What are examples of how risk communications have successfully affected community and/or individual level practices and behaviors on a scale significant enough to reduce the risk from zoonotic threats and/or AMR

3. Evidence for an active and sustainable engagement of the private sector
    - What are examples of how private sector partners have been actively and sustainably engaged in efforts to address zoonotic threats and/or AMR
    - What can be learned from partnerships with biomedical industry in developing and marketing vaccines and medical countermeasures? Employing novel diagnostic platforms enabling rapid detection and response to emerging threats?
    - What are examples of partnerships with industry in the use of non-medical countermeasures within communities to help mitigate, prevent, and control infectious disease threats? Employing new technologies and platforms for health communication and the application of non-pharmaceutical interventions.

4. Evidence for how consumer advocacy can contribute to change policies and practices

5. Evidence of economic benefits from PPC

Sub-theme 3: Understanding the Selection Pressures Underlying Emergence of Zoonotic Diseases and Antimicrobial Resistance and the Broad Benefits Realized From Promoting Healthy Animals and Healthy People

This sub-theme is focused on both:

a) exploring the contributions made by climate change, population growth, global travel, habitat change, expanding settlements, resource extraction, increased livestock and crop production and other underlying drivers that contribute to the emergence of new zoonotic and anti-microbial disease threats, and
b) examining the broad benefits that are accrued from promoting practices across multiple sectors that aim at reducing these drivers and the risk of zoonotic diseases and antimicrobial resistance.

There has been a general recognition that the adoption of a core set of best practices that are designed to directly target the drivers associated with zoonosis and AMR are likely to simultaneously contribute to positive outcomes across a range of "other" domains and the achievement of the United Nations Sustainable Development Goals, such as food security, household wealth and economic growth, as well as healthier environments and sustainable communities.

a) Issues to be discussed under this sub-theme will allow a presentation of the evidence for the drivers of EID emergence:

1. Evidence for Climate Change in Increasing Infectious Disease threats and models projecting future impact

- How does climate change contribute to spread of infectious disease threats
    - Topics to be considered could include: impact on vector ecology, animal migration, altered range and distribution of reservoir host species;
    - variance in freshwater availability, sanitation, and waterborne disease

2. Evidence for demographic and population change on increasing Infectious Disease threats, including how settlement patterns (peri-urbanization), population movement (increased air travel, trade etc), habitat change (impact on animal bio-diversity) contribute to disease emergence and spread

3. Evidence for how increased economic activity impacts on increased Infectious Disease risk, including how expanded incursions of extractive industry operations and agricultural intensification into wildlife domains increase risk for "spillover" and spread of novel diseases

- Options for how "risk" can be mitigated at the site of industry operations or in planning/selecting where industry operations occur

4. Evidence for how increased livestock production and marketing in geographic "hot spots" for disease emergence may increase risk of pathogen "spillover" and spread

- How projected increases in livestock production in Africa and shifting production contexts in Asia over the 21st century will impact on the risk of disease emergence, including zoonosis and AMR
    - Models for likely changes in terrestrial and aquatic animal production and marketing patterns over the coming century
    - Models for potential increased environmental impact that could elevate risk
    - Options for minimizing risks associated with increased livestock production and marketing

- Considering the impact of a global supply chain of agricultural commodities and production inputs (e.g. animal feed), and trans-continental risk management strategies

b) Issues to be discussed under this sub-theme also will allow a presentation of the evidence to broad collateral benefits accrued from targeting the drivers of EID emergence:

5. Evidence that adoption of practices to reduce zoonotic and AMR risks associated with livestock production would also contribute to more efficient and more profitable operations.

- How do improved biosecurity and husbandry practices that strengthen control of pathogenic zoonotic viruses improve the overall health of livestock and the environment
  - Reduced animal diseases
  - Improved animal health can lead to increased livestock productivity and reduced input costs for production
  - Enhanced productivity and yield per animal production unit
  - Reduction in prophylactic antibiotic use

- How does proper management of antimicrobials in livestock production and aquaculture improve economic returns
  - Improved hygienic conditions, nutrition, and vaccination in animal husbandry associated with reduced use of antibiotics and corresponding returns on investment
  - What can be learned from the experience of countries that have phased out and enacted regulatory controls on use of antimicrobials in animal production
  - AMR reduces potency of veterinary drugs and negatively affects animal health
  - Consumer demand for antimicrobial residue free animal source foods
  - Market based incentives and penalties for reduced antimicrobial use and enhanced adherence to drug withholding periods, minimizing residues in products entering the food chain
  - Best practices in strengthening antimicrobial usage regulatory and enforcement structures in animal production

6. Evidence that reduction in habitat fragmentation has led to the control of zoonosis

- How does habitat fragmentation impact on both vector-borne and non vector-borne diseases
  - Evidence that changes in habitat leads to changes (increase/decrease) the transmission dynamics of infectious diseases (e.g. chikungunya, malaria)

7. Evidence that that the real and/or projected economic impact from emerging zoonoses and AMR has informed resource allocation policies and an investment case for prevention

- What practices and approaches have shown promise in fostering decision making informed by economic analyses
- What novel structures have proven utility in transcending the challenge of inequitable sectoral cost and benefit distribution
  - Evidence for one or more sectors bearing the cost for benefits accruing to different sectors/stakeholders (e.g. H7N9 control in China: costs borne by producers and markets, but benefits accrue to health sector; or resource extraction and disease emergence: costs borne by health sector, but benefits accrue to industry and land planning/mining/forestry entities)

Venue and Dates of the Conference

Centara Grand at Central World Hotel, Bangkok

Monday 29 – Tuesday 30 January 2018	Side Meetings
Wednesday 31 January 2018	Field Trip
Thursday 1 – Saturday 3 February 2018	Main Conference

Structure of the Conference

This is a closed, invitation only conference host by the Prince Mahidol Award Foundation, and the Royal Thai Government, together with other international co-hosts. The conference consists of:

1. **Pre-conference**
    a. Side meetings
    b. Field trip

2. **Main conference**
    a. Keynote speeches
    b. Plenary sessions
    c. Parallel sessions
    d. Synthesis: Summary and recommendations
    e. Poster display

Pre-Conference Program

Monday 29 January 2018

09:00-17:30	Side Meetings

Tuesday 30 January 2018

09:00-17:30	Side Meetings

Wednesday 31 January 2018

06:30–18:00	Field Trip

Main Conference Program

Thursday 1 February 2018

09:00-10:30	**Opening Session & Keynote Address** Opening Session by **Her Royal Highness Princess Maha Chakri Sirindhorn** Keynote Address • Prince Mahidol Award Laureate 2017 • Prince Mahidol Award Laureate 2017 • **TBC**
10:30-11:00	Break
11:00-12:30	**Plenary 0: Vision 2100: Re-Imagining the End Game for the End of the Pandemic Era**
12:30-13:30	Lunch
13:30-14:30	**Plenary 1: Leadership Needed for Managing Emerging Infectious Diseases of the 21st Century**
14:30-16:30	**PS1.1: Lessons Learned in Managing Emerging Infectious Diseases (EID)** **PS1.2: Strategic Information and the Evolution of Emerging Infectious Diseases: Lessons from the Past and New Opportunities** **PS1.3: Safeguarding Medicines in the Era of AMR: What Do We Know? What Works?** **PS1.4: Financing Pandemic Preparedness: Where is the Money?** **PS1.5: One Health on the Move: Nomadic Communities**
16:30-17:00	Break
17:00-18:00	**Plenary 2: Futures of Partnerships for a Safer World**

Friday 2 February 2018

08:30-09:30	**Plenary 3: Managing Emerging Infectious Disease and AMR Risk across the Livestock Revolution**
09:30-10:00	Break
10:00-12:00	**PS2.1: Beyond MERS and Zika: Are we Prepared for the Next Big Epidemic?** **PS2.2: AMR: Addressing Excessive and Inappropriate Use of Antibiotics** **PS2.3: Dealing with an Inter-Connected World: Partnerships for Preparedness, Detection and Response during Mass Gatherings** **PS2.4: Changing Dynamics: Emerging Infectious Diseases and Antimicrobial Resistance in an Era of Expanding Global Human Population Growth and Movement** **PS2.5: Reducing the Gap: Addressing Neglected Disease; Neglected Populations**
12:00-13:00	Lunch
13:00-15:00	**PS3.1:** **PS3.2: Lessons Learned from a One Health Approach to AMR** **PS3.3: Climate Change and Emerging Diseases: The Importance of Resilient Societies** **PS3.4:**

	PS3.5: Policy Coherence: Effective Partnerships for Global Health
15:00-15:30	Break
15:30-17:30	**PS4.1: Moving Forward and Outward: Progress in Implementation of Global Frameworks and Initiatives** **PS4.2: Multi-sectoral Partnerships for Action on AMR** **PS4.3: Community Systems: the Bedrock of Responses to EID and AMR** **PS4.4: Finding the Win-Win Solutions for Better Health from Better Food Systems** **PS4.5: Bringing Solutions into Focus: Harnessing the Power of an Economic Lens**
18:00-20:30	**Welcome Dinner** • **Welcome Speech** by - Minister, Ministry of Public Health, Thailand - President, Mahidol University, Thailand • **Dinner Speech** by **Bill Gates**, Bill and Melinda Gates Foundation, USA (TBC)

Saturday 3 February 2018

09.00-09.30	**Closing Session** • **Speech** by **Margaret Chan**, Former Director General, World Health Organization, Switzerland (TBC)
09.30-10.30	**Synthesis: Summary, Conclusion & Recommendations**
10.30-11.00	**Statement**
11.00-12.00	**Closing Performance**
12.00-13.30	Lunch
14:00-16:30	**International Organizing Committee (IOC) Meeting for PMAC 2018/2019**

OPENING SESSION AND KEYNOTE ADDRESS

Opening Session

by Her Royal Highness Princess Maha Chakri Sirindhorn

Keynote Address

- Prince Mahidol Award Laureate 2017
- Prince Mahidol Award Laureate 2017
- **TBC**

PLENARY 0 (PL0)

Vision 2100: Re-Imagining the End Game for the End of the Pandemic Era

Background

We live in an era when the emergence of novel infectious disease agents is posing an increasing threat to global health and security. The threat from novel infectious diseases is accelerating at a pace and with an intensity unprecedented in human history, driven by increasing human populations, climate change and surging global travel. The possibility that a single lethal microbe could suddenly emerge and sweep through every household, through every community without regard to national borders or social and economic standing is a shared fear across the globe. Just the fear can cost billions, as illustrated by recent Ebola and Zika virus panics in little-affected countries. But the reality of the threat is all too clear, proven by the decades of response to the HIV-AIDS pandemic.

Zoonotic and AMR related diseases account for more than 95% of all emerging infectious diseases reported during the second half of the 20th century[5]. In this century the emergence of SARS, pandemic influenza, MERS, and the spread of Ebola and Zika reflect the world's increasing vulnerability to novel zoonotic threats. The simultaneous emergence of pathogens resistant to antibiotic therapies raises the prospect of a "post antibiotic" world. While the drivers underlying the emergence of zoonotic and antibiotic resistant diseases are complex, human behaviours and their impact on animal populations and the environment are understood to be central to the emergence of both disease threats. The role of increasing animal-human contact in the emergence of zoonotic diseases has been well documented and been increasingly the focus of One Health initiatives across the globe. The contribution made by the inappropriate use of antibiotics in animal husbandry to AMR is less well documented but in recent years has been increasingly understood to be a core driver behind the emergence and global spread of antibiotic resistant organisms, along with inappropriate "prescriber-user" practices associated with antibiotic use in clinical care. Changing environmental and climatic conditions have also been closely linked to the emergence of novel infectious diseases. That infectious disease emergence is closely associated with practices and behaviours at the animal-human-environment interface speak to the importance of an expanded multi-sectoral alliance across the animal, human and environmental sectors to address the threats posed by both zoonosis and AMR.

As we look forward towards the end of this century, the predictable escalation in the interactions between humans and animals speaks to a world of increasing global risk. The consequences of these trends, however, are avoidable. Success in "making the world safe from the threats of emerging infectious diseases" requires we think and act differently; to not continue with the half-measures that have made the world ill prepared to address these threats.

Rapid advances in science and a corresponding revolution in technologies allow us, for the first time, to imagine a world where these "threats" can be minimized. What is required is bold action; that embraces an aggressive time horizon; and, that is global in scope. Such action can build systems and

[5] K. E. Jones *et al.*, Global trends in emerging infectious diseases. *Nature* **451**, 990-993 (2008).

capacities able to mitigate the emergence of future threats and to control them when they do. With this knowledge comes the power to end panic and move to prevention.

This Plenary will present and discuss examples of new, innovative and bold global ventures which are now laying the groundwork for the "beginning of the end of the Pandemic Era".

Objectives

- Explore novel and transformative approaches that address the underlying drivers of zoonotic disease and AMR
- Harness methodologies, technologies, and thinking across a range of disciplines to promote a vision for a proactive approach to emerging zoonoses and AMR
- Enable a conversation that transcends current impediments and envisions possible pathways and enabling factors to realize the end of the "pandemic era"

Moderator

- **Dennis Carroll**, USAID

Keynote Speaker

- **Harvey Feinberg,** President, The Gordon and Betty Moore Foundation

Panelists

- **Richard Hatchett**, CEO, Coalition for Epidemic Preparedness Innovations (CEPI)
- **George Gao**, Director, China Center for Disease Control and Prevention
- **Margaret Hamburg**, President, American Association for the Advancement of Science (AAAS)
- **Larry Brilliant**, Chairman, Skoll Global Threats Fund

Note: All speakers to be confirmed

PLENARY 1 (PL1)

Leadership Needed for Managing Emerging Infectious Diseases of the 21st Century

Background

We now live in a world where any local infectious disease outbreak event has the potential to become an epidemic or pandemic. While preparedness of local agencies is key to quickly identify and contain outbreaks, global partnerships and international collaboration across all sectors must be effective to support and manage events. These partnerships have the potential to proactively alter the global architecture in order to quickly detect, prevent and respond to infectious disease threats as they emerge.

The plenary session will address the *Leadership Needed for Managing Emerging Infectious Diseases of the 21st Century*. It will set the scene of the global health architecture and how the international community is organizing to address effectively EIDs. It will also address leadership needed at country level for managing emerging infectious diseases.

The session will feature speakers from organizations with recent experience of preparing for, and responding to global health crises in the 21st century and consider how, as risks, environment and global architecture change, funding varies, how organizations change and adapt to tackle the contemporary challenges, and how are the lessons learned from recent challenges being incorporated into plans for future events. Speakers from countries and civil societies will bring a national and community level perspective on how to respond to global health crises.

Objectives

The objective is to identify what kind of leadership, at all levels, is needed to address the increased risk and the complexity of EID and AMR and bring together different partners and groups acknowledging the various organizational and sectoral cultures.

Moderator

- **Sylvie Briand**, WHO, Director Infectious Hazard Management

Panelists

- **Peter Salama**, EXD, WHO's Health Emergencies Programme – WHO perspective-
- **Elhadj As Sy**, Secretary General of the IFRC – civil society and community perspective
- **Francoise Barré-Sinoussi**, Nobel Prize Awardee for HIV discovery, Institute Pasteur – perspective on HIV pandemic management
- **Oly Ilunga Kalenga**, DRC MOH – country perspective

Note: All speakers to be confirmed

PLENARY 2 (PL2)

Futures of Partnerships for a Safer World

Background

This plenary is an interactive session that will introduce four core questions, based on the Futures approach, to shape the discourse of partnerships for greater biosecurity in the world. It will begin with an introduction of Futures thinking by Dr. Sohail Inayatullah, UNESCO Chair of Futures Studies and Professor at Tamkang University, Taiwan. Then, the plenary will involve a short discussion on the current state of partnerships or lack of in certain thematic areas, and challenges in forging effective partnerships. It will delve into exploring various futures for partnerships and what effective and inclusive partnerships can achieve to make the world a safer place for all. Attempting to jointly uncover the "unknown unknowns" within a Futures methodology will lead to an innovative approach in organizing an interactive plenary that would hopefully lead to new directions and interesting discussions within the parallel sessions.

Objectives

- To jointly envision possible scenarios for the future of partnerships in EID and AMR.
- To generate excitement in creating effective partnerships for a safer world by imagining alternate futures based on Futures techniques. It is envisioned that the novelty of the technique will add to the richness of PMAC and to bring in cross-disciplinary approaches into a Public Health conference.
- To get participants to think creatively in an out-of-the-box manner on working collaboratively together to build greater biosecurity for all.

Moderator

- **Sohail Inayatullah**, who is experienced in working on Biosecurity issues as well as other Development challenges

Panelists

- **Diah Saminarsih**, Special Advisor to Minister, Ministry of Health Indonesia, Indonesia
- **Sania Nishtar**, President, Heartfile, Pakistan
- **Ken Banks**, Founder, FrontlineSMS, United Kingdom

Note: All speakers to be confirmed

PLENARY 3 (PL3)

Managing Emerging Infectious Disease and AMR Risk across the Livestock Revolution

Background

Widespread demand for animal protein nutrition over the last half century has fueled an explosive growth in global livestock production systems. Between 2000 and 2030, demand for beef and dairy is expected to nearly double, and poultry to nearly triple. In select high growth regions, such as South Asia, demand for poultry is expected to soar to 725%.[6] Keeping pace with this demand, the production, marketing, and distribution of terrestrial and aquatic animal production has undergone transformational change. While rural livelihoods globally remain largely dependent upon grain, tubercle, and legume-based nutrition, an overall consolidation and commercialization of the production and marketing chains is shifting the disease emergence risk profile.

Increasingly, global animal product supply chains impact disease risk variably, through secondary and tertiary order effects that may be geographically separated. Within the context of zoonotic disease emergence risk, what are the linkages across geographically distinct areas where demand for animal protein is growing, the production of that protein, and the production of inputs such as animal feed? Can a total "emergence risk footprint" be developed to quantify this risk and prioritize reduced impact production scenarios? And what incentives and structures are needed to expedite a global shift toward such lower impact production systems?

The collective capacity to mitigate emerging zoonotic disease and AMR risks associated with increasingly complex global animal production chains will be dependent upon a robust understanding of the disease transmission drivers within these global systems. This session will enable a detailed evaluation of the role of animal production in potentiating zoonotic disease emergence and AMR, and will identify commonalities across regions, production contexts, and sectors that can inform applied risk mitigation approaches. While the session will focus on animal production systems, a balance with the role of anti-microbial use in crops, animal feed, and human health will need to be included.

Objectives

- Evaluation of terrestrial and aquatic animal production systems within the context of emerging zoonotic disease and AMR risk
- Understand how projected increases in livestock production in Africa and shifting production contexts in Asia over the 21st century will impact the future of farming systems and the risk of emerging zoonoses and AMR
- Identify common risk threads across regions, production contexts, and sectors that can inform applied risk mitigation approaches
    - Exploration of what is known about the quality and integrity of veterinary medicines - and their supply chains - used in animal production and their contribution to AMR risk.

[6] FAO. 2011. *Mapping supply and demand for animal-source foods to 2030,* T.P. Robinson & F. Pozzi. Animal Production and Health Working Paper. No. 2. Rome

- Review practical options for minimizing risks associated with increased animal production and marketing

Moderator

- **Dennis Carroll**, USAID

Panelists

- **Simplice Nouala**, African Union Interafrican Bureau of Animal Resources
- **Ugo Picaciamarra**, FAO
- **Peter Daszak**, EcoHealth Alliance
- **Dan Schar**, USAID

Note: All speakers to be confirmed

PARALLEL SESSION 1.1 (PS1.1)

Lessons Learned in Managing Emerging Infectious Diseases (EID)

Background

Several outbreaks since 2000 have shaped the way in which we prepare for and respond to infectious diseases outbreaks. The emergence of SARS CoV in the first years of this century was a wakeup call to the global health community followed by H5N1 avian influenza outbreaks and the first influenza pandemic in the 21st century. The renewed IHR (2005) marked a major change in the approach to global health security, going beyond specific diseases to apply to all health risks, irrespective of their origin or source.

Objectives

To present and discuss the management of a selection of recent crisis in different settings and draw lessons for the future. The session will tackle what works, what doesn't work from the political, public health, social and economic perspectives.

The following events will be discussed:

- **Ebola** : management of local and extended outbreaks: comparison of local outbreaks (DRC Uganda) and the epidemic in West Africa (2014-2015) with a particular emphasis on :
  - Community engagement and the socio-cultural aspects of outbreak response;
  - Cross-border collaboration between neighboring countries (surveillance, contact tracing, case management);
  - The role of international assistance;
  - Clinical management and vaccine.
- **MERS**: limiting spread example of Kingdome of Saudi Arabia, Republic of Korea and Thailand, managing the regional and global aspects of MERS-CoV, with a particular emphasis on:
  - Monitoring the health of international travelers and migrant workers;
  - Hospital preparedness
- **Zika and yellow fever** : managing vector borne outbreaks and emerging infectious diseases in Brazil / Angola (Yellow fever) and mitigating the risk of international spread (example of Portugal), with a particular emphasis on:
  - Controlling vectors and other environmental factors;
  - Vaccination and other preventive measures;
  - Effective communication to address public fear and potential panic.
- *Also **potentially discussed** : From SARS to influenza A(H7N9); lessons learned in China, with a particular emphasis on:*
  - *Addressing the human-animal interface and cross-sectoral collaboration;*
  - *Resolving conflicting interests between the commercial and public health sectors*
  - *Strengthening preparedness based on experience of past outbreaks*

Keywords: Ebola, Zika, MERS, Influenza, contact tracing, clinical management, migrations.

Moderator

- **Ron St John**, Public Health Agency of Canada

Panelists

- **Bruce Aylward**, WHO, Special Representative for Ebola Response – Ebola response
- **Adullah Assiri**, KSA MOH – MERS (country of origin)
- Director General, Department of Disease Control, Ministry of Health, Thailand
- **João Paulo Toledo**, Director, surveillance department, Ministry of Health, Brazil
- **Francisco George**, Portugal MOH – yellow fever: stockpiling and preventing importation and spread of infectious viruses

Note: All speakers to be confirmed

PARALLEL SESSION 1.2 (PS1.2)

Strategic Information and the Evolution of Emerging Infectious Diseases: Lessons from the Past and New Opportunities

Background

The last century has witnessed an increase in the frequency of emerging infectious diseases (EID) and antimicrobial resistance (AMR). Climate change, environmental pressure, population movement, population growth and increasing overlaps between human and animal livelihoods have contributed to an acceleration of novel infectious diseases. In addition, the increasing pace of human and animal pathogens resistant to antibiotic therapies raises serious concerns about treatable infections becoming life threatening, raising the death toll and the economic cost to potentially unsustainable level within decades.

In this context, early warning systems and strategic information play a key role in preventing, detecting and responding adequately to emerging zoonosis and antimicrobial resistance. More surveillance systems are needed. New technologies, electronic health records, internet and social media have the potential to provide timely information on emerging infectious diseases and antimicrobial resistance that can supplement traditional surveillance systems. With these new tools, individuals and their communities can play a new role in participatory syndromic surveillance. Nevertheless, there are important caveats that need to be addressed, such as ensuring data privacy, underrepresentation of some categories such as infants, the elderly, or people lacking access to these new technologies.

Objectives

This session will look at the recent changes in strategic information and how can they contribute to current surveillance systems in order to identify appropriate actions and interventions for preparedness and response to emerging infectious diseases and antimicrobial resistance.

Moderator

- TBD

Panelists

- Shweta Bansal, Department of Biology, Georgetown University, Washington, USA
- Laurel Sprague, Executive Director GNP+, The Hague, The Netherlands
- Marcel Salathé, Centre for Infectious Disease Dynamics, Penn State University, Pennsylvania, USA or Caroline Guerrisi Sorbonne University, INSERM
- Margaret D. Straton, Tufts University Initiative for Forecasting and Modelling of Infectious Diseases (InForMID), Medford, Massachusetts, USA or Sarah Del Valle, Los Alamos National Laboratory New Mexico, USA
- Osama Ahmed Hassan, Umea University, Sweden, Public Health Institute, Khartoum, Sudan
- Amy Wesolowski, Centre for Communicable Disease Dynamics, Harvard TH Chan School of Public Health

Note: All speakers to be confirmed

PARALLEL SESSION 1.3 (PS1.3)

Safeguarding Medicines in the Era of AMR: What Do We Know? What Works?

Background

The prevention, detection and mitigation of emerging and re-emerging infectious diseases involve both applying preventive controls in animal production as well as ensuring the safety, efficacy, quality, and appropriate use of vaccines, diagnostics and medicines through secure supply chains and health delivery systems.

Complex and fragmented supply chains, especially in countries and regions with limited regulatory and quality oversight, increase the likelihood of substandard, fraudulent or adulterated medicines entering the market. Poor quality medicines ensure microbial replication in the presence of drug pressure. Substandard and falsified medicines also contribute to lack of efficacy and adverse events, undermining trust in the health system. Inappropriate use of anti-microbials is another driver of AMR. Both poor quality medicines and inappropriate use are preventable and can be addressed through the development of robust regulatory and quality assurance systems, treatment guidelines and enforcement.

While there are major limitations in evidence and best practice in the human health sector, even less is known in the veterinary sector, both with respect to use and quality of antibiotics in animals, and effective controls. Further, environmental factors are beginning to come to light.

Objectives

- Review evidence of what is known about the links between medicines quality and AMR.
- Highlight successful efforts in, and benefits from, strengthening systems that monitor and strive to improve medicines quality.
- Address environmental impacts of antibiotic manufacturing on AMR.
- Relate frameworks for addressing medicines quality and appropriate use in the human sector to the animal sector and discern what lessons and approaches from other initiatives could be mobilized to address these drivers of infectious disease risk and AMR.

Moderator

- **Katherine Bond** – overview of issue/session and introduction

Panelists

- Panelist 1 – Overview of evidence linking medicines quality and use to AMR; directions for more attention and link to current response (Proposed: **Michael Deats**, WHO)
- Panelist 2 – Reflections on effective strategies, approaches and benefits to strengthen medicines quality monitoring and quality assurance systems (Proposed: **Margareth Ndomondo-Sigonda**, Tanzania)

- Panelist 3 – Reflections on veterinary sector; insights into how approaches on drug quality and use in human health sector could be applied in the veterinary health sector (Proposed: **Angkana Sommanustwichai**, London School of Hygiene and Tropical Medicine/IHPP Thailand
- Panelist 4 – **Sasi Jaroenpoj**, Head of Veterinary Medicinal Product, Department of Livestock Development, Ministry of Agriculture, Thailand
- Panelist 5 – Environmental impacts of antibiotic production: Proposed: **Dan Andersson**, Department of Biochemistry and Microbiology, Uppsala University, Sweden
- Panelist/Discussant – Broad overview and reflections on how medicines quality and practices contribute to ID and AMR risk from; experience in outbreaks; and links to current initiatives/broad perspectives (Proposed: **Margaret Hamburg**, National Academies of Medicine)

Note: All speakers to be confirmed

PARALLEL SESSION 1.4 (PS1.4)

Financing Pandemic Preparedness: Where is the Money?

Background

Recent experiences with the Ebola, Zika, and SARS outbreaks, among others, have underscored the need for countries to invest in pandemic preparedness, and to do so not only from a health perspective but also from an economic perspective: the socio-economic cost of outbreaks is often proportionally much larger than the corresponding impact on mortality and morbidity.

The International Working Group on Financing Preparedness (IWG) has recently made several recommendations to integrate pandemic preparedness into international macro-economic and market assessments that determine the availability of concessionary and other international financing eligible lower and middle income countries.

To date, however, what has largely been missing in global and country-level discussions is a systematic understanding about adequacy and modality of *current* financing arrangements for health security. Part of pandemic preparedness is embedded in health financing and service delivery. Part also deals with animal health which is the responsibility of livestock/agriculture sector. In addition to its multisectoral nature, there are contingency financing arrangements for pandemic preparedness that may or may not be linked to how countries manage other natural or man-made disasters. There is also risk that health security and pandemic preparedness may get lost in health financing transition that focuses more on financial protection and access to individual services than public goods.

Given the complexity of pandemic preparedness, better understanding of the current financing landscape would enable an informed dialogue on financing gaps and how best they could be filled given domestic and international fiscal constraints. The nature of health security implies that some of the objectives and functions that may be applicable to a generic health financing system would need to be amended to consider some of the unique characteristics of the specific sub-set of activities that constitute health security.

Objectives

The objective of this session is to discuss issues on financing health security within the broader context of trends in health and public financing more generally. Specifically, the session will:

- Provide an overview of how to conceptualize and estimate financing for health security, including preparedness, response and recovery;
- Present and discuss some preliminary findings on health security financing analysis from select countries, including a 10-year evaluation of OIE PVS Pathway and gap analysis to strengthen/finance veterinary services;
- Examine key domestic policies and interventions to ensure sustainable financing for pandemic preparedness and opportunities for mobilizing domestic and international financing for rapid response.

Moderator

- **Timothy Grant Evans**, Senior Director, Health, Nutrition and Population Global Practice. World Bank Group

Panelists

- **Netsanet Workie**, Senior Health Economist, World Bank Group. *Experiences from Health Security Financing Assessment Tool (HSFAT)*
- **Ronella Abila**, OIE sub-regional representative Southeast Asia. *10 years of experience with OIE PVS Pathway*
- **Eduardo Banzon**, Principal Health Specialist, Asian Development Bank. *Financing Health Security in the Mekong Region*
- **Tran Dac Phu**, General Director, General Department of Preventive Medicine, Vietnam. *Country Experience*
- **Julian Naidoo**, Chief of Party, Wits Health Consortium, South Africa. *Country Experience*
- **Benjamin Rolfe**, CEO, Asia Pacific Leaders Malaria Alliance. *Civil Society perspective*

Note: All speakers to be confirmed

PARALLEL SESSION 1.5 (PS1.5)

One Health on the Move: Nomadic Communities

Background

Fully dependent on their animals for their livelihood and income, pastoralists employ mobility as a key strategy to ensure the availability of pasture and water for their herds, thus increasing their resilience. While their movement allows them to overcome the vagaries of nature prevalent in the harsh environments they inhabit, their remoteness and often trans-boundary livelihoods have made it challenging to access services and engage in decision-making. Pastoralist are at the forefront of the human, livestock and wildlife interface. They are especially vulnerable to zoonotic diseases, because they live in close contact with their animals and often consume raw milk and meat. Furthermore changing environmental conditions also affect the availability of pasture for their animals, and in-turn affect their nutrition status.

The animal-human-environment sectors are interconnected and associated with the emergence of infectious diseases as Middle East Respiratory Syndrome (MERS). Multisectoral approaches such as One Health can help address the challenges at this interface by providing adapted vaccinations campaigns and veterinary services to pastoralists.

Objectives

- To foster a deeper understanding of the health risks faced by mobile pastoral communities, and the challenges they encounter in accessing animal and human healthcare
- To share examples of interventions and policies that tackle pastoralists' health issues at the animal-human-environment interface
- To promote the participation of pastoral communities in health policy decisions and sanitation campaigns

Moderator

- **Gregorio Velasco Gil**, Food and Agricultural Organization of the United Nations

Panelists

- **Asiimwe Benon**, Associate Professor. Makerere University
- **Maty Ba Diao**, Regional Coordinator of the Support Pastoralism in Sahelian Countries project- CILSS.
- **Marite Alvarez**, Pastoral representative. Argentina. Pastoamericas.
- **Taghi Farvar**, Pastoral representative. Iran. Cenesta.

Note: All speakers to be confirmed

PARALLEL SESSION 2.1 (PS2.1)

Beyond MERS and Zika: Are we Prepared for the Next Big Epidemic?

Background

Over the past decade, Ebola, MERS, highly pathogenic avian influenza and, more recently, the Zika virus outbreaks have demonstrated the ability of epidemics to devastate communities through both extraordinary losses of life and severe morbidity as well as adverse social and economic impacts that jeopardize global health security. These recent disease outbreaks have not only made evident countries' lack of preparedness to adequately prevent, detect and respond to epidemics, but also the extent to which measures must cut across governance levels and all sectors of society in order to truly be effective. Furthermore, only one third of countries have met their commitments under the International Health Regulations (IHR). And although several tools and frameworks have been developed (by WHO, USAID, CDC, OIE, etc.) to provide guidance for countries to develop country epidemic preparedness and response plans, these are generally disease specific, have not been updated or tested through routine exercises, remain largely underfunded and are, therefore, not fully operational. As a result, many countries remain unprepared to prevent, detect, mitigate risks and respond to health threats and disease epidemics before they cause devastating consequences in the livelihoods of communities and the economies of countries.

Objectives

- To present country experiences on strengthening IHR core capacities, including efforts for effective coordination, partnership models and financing mechanisms to strengthen health security.
- To identify critical elements needed for sustainable, inclusive, and effective preparedness at country level and propose solutions for more effective epidemic preparedness guidance.
- To discuss gaps in the current guidance and frameworks that need to be filled to develop country epidemic preparedness and response plans.

Moderator

- **John Nkengasong**, Director, Africa CDC

Panelists

- **Isabella Ayagah**, IHR Focal Point, Ministry of Health, Kenya. *Strengthening Pandemic Preparedness across Sectors in Kenya: Lessons Learned & the Way Forward*
- **Ronello Abila**, OIE sub-regional representative Southeast Asia. *Lessons Learned from 10yrs of Implementing the OIE PVS Pathway*
- **Tran Dac Phu**, General Director, General Department of Preventive Medicine, Ministry of Health, Vietnam
- **Casey Barton Behravesh**, Director, One Health Office, U.S. CDC

Note: All speakers to be confirmed

PARALLEL SESSION 2.2 (PS2.2)

AMR: Addressing Excessive and Inappropriate Use of Antibiotics

Background

The tripartite, Food and Agricultural Organization, World Health Organization and World Organization for Animal Health and other relevant organizations had declared Antimicrobial resistance (AMR) a serious and growing global public health threat. The loss of effective antibiotics is reducing an ability to protect people from infectious diseases, with profound impacts on healthcare systems, global trade, agriculture, environment and health sectors. Based on World Bank Group projections of the world economy in 2017-2050, if AMR problems continue at the current pace, the annual global GDP would fall by 1.1-3.8% by 2050 and the global healthcare cost would range from US$ 300 billion to more than US$ 1 trillion.

Though AMR is a natural mechanism of pathogen survival; the excessive and inappropriate use of antibiotics are key drivers of the emergence of antimicrobial resistance. Decision to prescribe antibiotics by health professionals still occurs in the absence of adequate information about the nature of the infection or before the results of diagnostic and sensitivity tests become available. Moreover, the regulation of antimicrobial use is poorly enforced in some areas, such as over-the-counter, unregulated use of antibiotic in agriculture, substandard medicines for both human and animal antibiotics.

Several attempts to optimize use of antibiotics in human and animal sectors have shown in the last decade at global, regional and national levels. To fulfill key action proposed by the Global Action Plan, countries need to strengthen the evidence base through surveillances of AMR and the consumption of antimicrobials, and strengthen regulation of the distribution and use of antibiotics in human and animals. The information on AMR and antibiotic consumption will guide the treatment of patients and inform local and national actions. Thus, antibiotic, as a global public good requires regulation on distribution and use.

It is imperative that PMAC audiences recognize the drivers contributing to excessive and inappropriate use of antibiotics; but more importantly, learn and share practical and successful solutions.

Objectives

The panelists in this session will address the following questions

On problem streams

1. Why there are excessive and inappropriate use of antibiotics in humans, animals and crops (i.e. in citrus for treatment of greening disease), such as self-medication of antibiotic from over-the-counter purchases, inefficiently regulated the use of antibiotic. Stakeholder analysis are helpful to unpack the complexity. Key actors involved in the use of antibiotics:
   a) Demand for antibiotics: patients and farmers,
   b) Supply of antibiotics: pharmaceutical industry, professionals: veterinarians, physicians and pharmacists,

On solution streams

2. What are the good practices and lessons for countries or regional organization such as ECDC and networks such as ESAC and ESVAC, to develop and maintain an effective system for surveillance of AMR, antimicrobial consumption and Point prevalence survey in human, and animal?
3. How evidences of surveillance of antimicrobial consumption are used:
    a. To guide antibiotic prescribing decisions of health professionals
    b. To formulate, support and monitor policies which curb down antimicrobial consumption and promote rational use of antibiotics
4. What are the challenges of use of antibiotics in crops? Is there any monitoring system on impacts of antibiotic use in crops, such as antibiotic resistance in food crops and environment, and antibiotic residue in environment and food crops?
5. How does the regulatory system support the control of antibiotic use?

On recommendations

6. What are the policy interventions on "demand" and "supply" sides, which address the excessive and inappropriate use of antibiotics in developing countries?

Moderator

- **Klara Tisocki**, WHO SEARO

Panelists

- **Otto Cars**, Senior Professor, Founder and senior adviser, ReAct-Action on Antibiotic Resistance, Uppsala University, Sweden
- **Jonathan Rushton**, Professor of Animal Health and Food Systems Economics Epidemiology and Population Health, University of Liverpool
- **Lilit Ghazaryan**, Scientific Center of Drug and Medical Technology Expertise, MoH, Armenia
- **Angkana Sommanustweechai**, Doctoral student at LSHTM on AMR, IHPP Thailand

Note: All speakers to be confirmed

PARALLEL SESSION 2.3 (PS2.3)

Dealing with an Inter-Connected World: Partnerships for Preparedness, Detection and Response during Mass Gatherings

Background

Mass gatherings are recognised to have the potential to enhance spread of infectious diseases as well as being potential targets for deliberate events. Although both these risks are unlikely, the rise of Zika infection in the run up to the Rio 2016 Olympic and Paralympic Games and Middle East Respiratory Syndrome (MERS) in Saudi Arabia highlighted how these events can create a perceived, if not actual, global health threat and a political as well as health challenge.

The inspiration of this session derives from the next three Olympiads (Winter 2018, Summer 2020 and Winter 2022) being in the western pacific region (S Korea, Japan and China respectively). This session will be based on previous sporting mass gatherings such as the Rio Olympics, the London Olympics, and the World Cup, religious gatherings such as the Hajj, and large state events such as the King's funeral in Thailand. The session aims to share learning and best practices from a biosecurity and terrorism perspective and to explore how such mass gathering events can best be planned to minimise any health risks. Many mass gatherings, especially international sporting events, are organised by what are effectively private sector companies and the relationship between the private and public sector partners is vitally important.

Objectives

- To share learning and experience from previous events
- To explore effective risk mitigation strategies
- To examine the health and political interface of mass gatherings, including private sector partners
- To explore how mass gatherings can be used to improve global health security capacity

Moderator

- **Brian McCloskey**, Senior Consulting Fellow, Chatham House; Consultant in Global Health Security, Public Health England; & Professor, Faculty Epidemiology and Population Health, London School of Hygiene and Tropical Medicine

Panelists

- **Tina Endericks**, Director, WHO Collaborating Centre on Mass Gatherings and Global Health Security, Public Health England, London
- **Maurizio Barbeschi**, Mass Gathering Unit, WHO, Geneva
- **Lucille Bloomberg**, National Institute Infectious Diseases, South Africa
- **Badriah Alotaibi**, Global Centre for Mass Gathering Medicine, Riyadh, Saudi Arabia
- Speaker (to be identified) from Thailand Ministry of Health
- **Koji Wada**, National Centre for Global Medicine, Tokyo

Note: All speakers to be confirmed

PARALLEL SESSION 2.4 (PS2.4)

Changing Dynamics: Emerging Infectious Diseases and Antimicrobial Resistance in an Era of Expanding Global Human Population Growth and Movement

Background

The global human population is projected to peak at over 11 billion this century. Accelerated human population growth and corresponding changes in demography, along with associated food and companion animal population increases, are altering disease dynamics and will continue to drive emerging infections and transmission over the course of the next century. This session will explore the connections among infectious disease emergence, antimicrobial resistance (AMR), and changing human and animal population dynamics. We will explore the state-of-the-art in emerging disease and AMR detection and forecasting and answer the question, "How can we minimize emerging disease and AMR risks linked to changing demography."

Objectives

This session aims to explore and address the impacts of growing human and animal populations and unplanned mega-cities and peri-urban settlements on disease emergence, amplification, and global distribution. Accordingly, presenters will also tackle the risks associated with surging global trade and travel and illustrate how forecasting can inform risk mitigation.

Specific Objectives:

- Explore projected demographic trends over the 21st century and their impact on expected zoonotic disease emergence and AMR
- Enhance understanding of how trends in demography will differ regionally; how differences in agricultural productivity and marketing practices will impact emerging disease risk, including spread of AMR; and how purchasing power and animal protein demand will have global supply chain impacts and associated emerging disease risk
- Highlight practical, evidence-driven approaches to defining, forecasting, and mitigating human demographic-driven emerging disease risk

Moderator

- **Jonna A.K. Mazet**, University of California, Davis

Speakers

- **Martin (Marty) Cetron**, Division of Global Migration & Quarantine, US CDC
- **Saber Yezil**, WHO/MoH, Saudi Arabia
- **Thuy Bich Hoang**, Viet Nam, Wildlife Conservation Society
- **Christine Kreuder Johnson**, University of California, USA Davis/Nepal context
- **Evelyn Wesangula**, Global Antibiotic Resistance Partnership-Kenya
- **Kamran Khan**, Associate Professor, Department of Medicine, Division of Infectious Diseases, University of Toronto, Canada
- **Olaniran Alabi**, Nigeria Chief Veterinary Officer

Note: All speakers to be confirmed

PARALLEL SESSION 2.5 (PS2.5)

Reducing the Gap: Addressing Neglected Disease; Neglected Populations

Background

Preventable, endemic diseases are rarely prioritized for surveillance as they do not pose a risk of epidemic or pandemic outbreak. This is a failing on two levels: (1) the presence of preventable diseases acts an indicator of the overall state of the health system; and (2) the knowledge of 'usual' allows for detection of the unusual. Strengthening surveillance and other systems for endemic diseases, infectious or otherwise, provides necessary infrastructure to combat the existing and target the emerging. In addition, most of these subsisting populations live in close proximity with their animals and experience a double burden, disease in their animals and disease in their families and communities. A pro-poor initiative on a massive scale, control of NTDs has much to offer in terms of what can be adapted, innovated and built in low-resource settings most burdened by NTDs in an agenda that makes poverty alleviation its overarching objective and aims to leave no one behind.

The success celebrated for some of the NTDs shows that it is possible to build private-public partnerships that lead to concrete results, such as the Global Partners' Meeting on NTDs based on the theme "Collaborate. Accelerate. Eliminate". This encapsulates an exemplary informal collaboration that marks a 'turning point' in global efforts to control and eliminate poverty-related diseases.

The discussion will center on forging cross-sectoral partnerships to tackle NTDs and "diseases of poverty", and will include a range of elements crucial to an effective collaboration across sectors such as financing, research and development, production and delivery of vaccinations and treatment, disease surveillance, role of local communities and other actors on the field. It will elucidate the incentives of building effective cross-sectoral and public-private partnerships by using the case of NTDs. Lessons may be derived from the NTD experience to other areas requiring cross-sectoral partnerships in health where a population-based intervention is appropriate.

Objectives

Marginalized and neglected populations bear the epidemic risk of infectious diseases especially neglected tropical diseases. They are more exposed to disease vectors as well as have less access to effective and timely health care. Without addressing prevention, detection and response among this segment of the population, the world cannot be safe from infectious disease. This session aims to discuss successful examples of cross-sectoral partnerships across human and animal health sectors to tackle "diseases of poverty" including financing, vaccine development, and distribution as well as delivery. It will also address how to target this neglected segment of the population against the threat of infectious diseases. Intervention based approaches through specific diseases can be discussed as well as tackling access and inclusion into the health system through a social determinants approach. Tackling NTDs is addressing the causes of poverty and the pathways to reach the poorest and most vulnerable in society those that will have slower access to universal health coverage and would be a pathway to strengthen health systems, human, animal and environmental.

Moderator

- Dan Normandeau (TBC)

Panelists

- Mark Bradley, Director Global De-worming , Global Health Programs, GSK
  Or, Klaus Brill, Vice President Corporate Commercial Relations, Bayer Pharmaceuticals
  Or, Alasdair King, Director, Intergovernmental Veterinary Health Merck Animal Health
- Dr Nwankwo Uzoma, Senior Medical Officer and Health Economist, Ministry of Health, Nigeria
- Dr Amila Gunesekera, MD, Medical Officer in charge Rabies treatment National Hospital of Sri Lanka
- Harena Rasamoelina, Veterinary epidemiologist, Indian Ocean Commission
- Representative from local NGO involved in distribution and delivery of vaccines/treatment (TBC)
- Representative from WHO or UN system (TBC)
- Representative from CEPI co-founders or Board (TBC)

Note: All speakers to be confirmed

PARALLEL SESSION 3.1 (PS3.1)

To be updated

Note: All speakers to be confirmed

PARALLEL SESSION 3.2 (PS3.2)

Lessons Learned from a One Health Approach to AMR

Background

Antimicrobial resistance (AMR) is a major threat to global health, the world economy, food safety and food security, and therefore poses a unique challenge to humanity. All countries – regardless of their economic situation, the strength of their health systems or their level of antibiotic consumption – will face disastrous consequences if the spread of AMR is not contained. Global and community solutions are needed to prevent overuse of antibiotics, including development of new vaccines, improved diagnostic tests and, above all, universal access to antibiotics which are affordable and effective against drug-resistant diseases. Antimicrobials also play a significant role in both plant and animal health, and therefore, in global food production. While the important goal of reducing antibiotic usage for growth promotion in animals is increasingly implemented, antibiotics will be needed in maintaining the health of food-producing animals, and the safety of their products.

AMR occurs when disease-causing pathogens (including bacteria, fungi, parasites, or viruses) develop defense mechanisms against the drugs designed to treat them, making these resistant pathogens difficult or even impossible to treat. This resistance is the inevitable result of antimicrobial use and an example of natural selection in practice. The more antimicrobials are used, the less effective they become. Rising levels of AMR are a sign that natural selection is taking place more rapidly than innovation in developing new antimicrobials. If this process is to be reversed, the world must innovate more, but also slow natural selection – by eliminating excess use of all antimicrobials; only using second- and third-level treatments when absolutely necessary; and ensuring appropriate access to treatments.

The importance for countries to develop and implement one health focused national action plans

In line with the Global Action Plan on Antimicrobial Resistance, developed by WHO with participation and endorsement by the OIE and FAO, the development of countries' own National Action Plans (NAPs) on AMR is an essential first step towards establishment of an effective response to combat AMR. At the Sixty-eighth WHA in 2015, Member States committed to have NAPs in place by May 2017. Also in 2015, the OIE World Assembly of Delegates adopted Resolution No 26, committing to development of NAPs in the spirit of "One Health", taking into account the use of antimicrobial in animals and ensuring collaboration with public health officials. In February 2016, WHO, in collaboration with FAO and OIE, developed a manual for developing NAPs on AMR and a set of accompanying tools. The three organizations have been working closely with stakeholders to provide technical support to countries for the effective development of their NAPs.

Sharing Expertise for a Coordinated AMR Response

Ensuring political commitment, engagement and support has been a challenge as understanding of AMR, multisectoral collaboration and the importance of developing and implementing NAPs is still somewhat limited. The identification of best practices in human, animal and plant health continues to play an important role as the world is still learning what works best in particular contexts. WHO is sharing expertise regarding human health and developing communities of practice to support countries with ongoing efforts. Inter-sectoral action, and the complexity of coordination within and across sectors, continues to be a challenge, particularly as countries shift towards NAP implementation.

Global Action Plan for Antimicrobial Resistance

At the Sixty-Eighth World Health Assembly in May 2015, WHO Member States endorsed a global action plan through resolution WHA68.7 to tackle antimicrobial resistance, including antibiotic resistance, the most urgent drug resistance trend.
The AMR global action plan contains five major strategic objectives:

1. to improve awareness and understanding of antimicrobial resistance;
2. to strengthen knowledge through surveillance and research;
3. to reduce the incidence of infection;
4. to optimize the use of antimicrobial agents; and
5. to develop the economic case for sustainable investment that takes account of the needs of all countries, and increase investment in new medicines, diagnostic tools, vaccines and other interventions.

The global action plan, which takes into account the commitment, perspectives and roles of all relevant stakeholders is a plan in which everyone has clear and shared ownership and responsibilities. The endorsement of the plan reflects a global consensus that AMR poses a profound threat to human health.

One Health Approach
Addressing the rising threat of AMR requires a holistic and multisectoral ("One Health") approach because antimicrobials used to treat various infectious diseases in animals may be the same as or similar to those used in humans. Resistant bacteria arising in humans, animals, plants or the environment may spread from one to the other, and from one country to another. One Health recognizes that the health of humans, animals and ecosystems are interconnected. It involves applying a coordinated, collaborative, multidisciplinary and cross-sectoral approach.

The WHO, FAO and OIE speak with one voice and take collective action to minimize the emergence and spread of AMR. The aim is to:

- Ensure that antimicrobial agents continue to be effective and useful to cure diseases in humans and animals;
- Promote prudent and responsible use of antimicrobial agents;
- Ensure global access to medicines of good quality.

Objectives

- To gain a better understanding of how the world can learn from the past 2.5 years of AMR response since the Global Action Plan as we shift from development of AMR strategies towards implementation
- To identify main challenges and successes in implementing national action plans and determine ways to productively more forward

Moderator

- **Martha Gyansa-Lutterodt**, Chief Pharmacist of Ghana, IACG Member

Panelists

- WHO
  - **Marc Sprenger**, Director of AMR Secretariat, WHO
- FAO
  - **Juan Lubroth**, Chief Veterinary Officer, FAO
- OIE
  - **Matthew Stone**, Deputy Director General, OIE
- Professional association – health

  - **Judith Shamian,** President, International Council of Nurses
- Professional association – agriculture
  - **Marco Marzano de Marnis**, Secretary General, World Farmers Association

Note: All speakers to be confirmed

PARALLEL SESSION 3.3 (PS3.3)

Climate Change and Emerging Diseases: The Importance of Resilient Societies

Background

During the long processes of human cultural evolution, population dispersal, and subsequent inter-population contact and conflict, several distinct transitions in human ecology and inter-population interactions have changed profoundly the patterns of infectious disease in human populations. As we move further into the 21st century, the spread and increased lability of infectious diseases, new and old, reflects the impacts of demographic, environmental, technological and other rapid changes in human ecology. Climate change, one of the global environmental changes under way, is anticipated to have a wide range of increased impacts upon the occurrence of infectious diseases affecting human, animal, and plant populations.

Climate and weather patterns affect the distribution and risk of many infectious diseases, including vector-borne diseases such as malaria, Rift Valley fever, plague, encephalitis and dengue fever. Weather patterns also affect the distribution of food- and water-borne diseases and emerging infectious diseases such as West Nile virus, Hantavirus, and Ebola hemorrhagic fever and the sporulation of diseases such as anthrax and other clostridia.

The effect of climate variability on infectious diseases is determined largely by the unique transmission cycle of each pathogen. Transmission cycles that require a vector or non-human host are more susceptible to external environmental influences than those diseases which include only the pathogen and human. Important environmental factors include temperature, altitude, precipitation and humidity. Several possible transmission components include pathogen nature (viral, bacterial, etc.), vector (mosquito, snail, etc.), abiotic physical vehicle (water, soil, etc.), non-human reservoir (mice, deer, etc.), and human host.

Humans are more than passive recipients of climate change-induced health effects. We can play a significant and active role through proactive adaptation and mitigation measures in order to control and alleviate the negative health impacts of climate change. The magnitude of changes in climate variables varies across the globe, posing more challenges and stresses for some groups, societies and populations than others. Given the same magnitude of climate change, some population groups and areas are more vulnerable to the elevated risks due to their lack of the ability and resources to effectively respond to the stresses and challenges, including nutrition, immune status, and access to goods, services, and clean water. Inadequate public policies may be perpetuating the marginalization that increases vulnerability to adverse events or change processes. Given that infectious diseases do not confine themselves within a vulnerable population group, these diseases pose a shared global risk and require a coordinated global effort to reduce their vulnerability to climate change-induced health risks. Importantly, human vulnerability to the changing risks for infectious diseases driven by climate change may be altered through proper adaptation measures. Examples include the continuous evolution of public health programmes, the cyclical re-allocation of financial and health care resources and the pre-emptive alteration of policies following scientific projection of spatial–temporal changes in health risk for human infectious diseases. Early warning systems based on such projections have been proven effective in helping societies take proactive measures to prevent or alleviate the possible health impacts.

Objectives

- Explore projected trends in climate change over the 21st century, and their expected impact on infectious disease emergence/re-emergence and AMR
- Highlight practical, evidence-driven policy and approaches to defining and mitigating human-driven emerging disease risk

Moderator

- **Pradeep Kurukulasuriya**, GEF/GCF, UNDP Bangkok

Panelists

- **Sander Koenraadt**, Wageningen University, Netherlands. Climate change and vector-borne diseases; climate change effects on highland malaria, arboviruses.
- Two panelists from government /NGO partners involved in GEF projects on Strengthening national capacities for health and climate change adaptation. Selected speakers to represent case studies from Nepal **Meghnath Dhimal** (Consultant on leave from MOH) and Bangladesh **Iqbal Kabir** (MOH)
- **Montira J. Pongsiri** PhD, MPH, Senior Research Associate, Planetary Health Science Policy, Cornell University, College of Veterinary Medicine, Dept. of Population Medicine and Diagnostic Sciences
- **Kristie Ebi**, Professor, visiting at Department of Public Health and Clinical Medicine Occupational Medicine, Umea University.

Note: All speakers to be confirmed

PARALLEL SESSION 3.4 (PS3.4)

To be updated

Note: All speakers to be confirmed

PARALLEL SESSION 3.5 (PS3.5)

Policy Coherence: Effective Partnerships for Global Health

Background

The 2030 Agenda for Sustainable Development set ambitious health-related targets to "ensure healthy lives and promote well-being for all at all ages" and "strengthen the means of implementation and revitalise the Global Partnerships for Sustainable Development". To this end, for example, the epidemics of AIDS, tuberculosis, malaria and neglected tropical diseases, as well as effectively addressing the threat of emerging infectious zoonotic diseases will require substantial policy coherence and investments. These are critical for the needed health innovations, as well as the development of systems-wide capacities within countries for the necessary measures of "prevention, detection and response".

While many global efforts have focused on increasing research and development for new health innovations, it is also now clear that there must be a corresponding emphasis on strengthening systems and capacities to deliver the range of needed health services and products. The Ebola outbreak in West Africa was an important reminder of the importance of effective, and continuing, core government functions, within and beyond the health sector. As the global community contemplates responses to address epidemics and infectious diseases, the imperatives for ensuring an integrated approach are clear: effective partnerships are required between the public, private and the community sectors.

This signals a clear need for increased policy coherence, which demands coordination between a broad range of actors; not just between government agencies, private sector and community actors at the national and local levels, but also between those working at the global level, including on innovation, R&D, financing, governance and management. Addressing interconnected elements, and encouraging effective synergies of efforts of stakeholders in the public, private and community sectors, will be critical, not only in effectively addressing infectious and new emerging diseases, but also in helping low- and middle-income countries (LMICs) achieve universal health coverage (UHC) and other health-related targets.

Objectives

In this context, the session aims to stimulate a dialogue between key stakeholders with the aim of identifying how public-private-community partnerships (PPCs) can address the needs of LMICs for effective "prevention, detection and response" to the threat of infectious diseases. The aim is to generate recommendations and proposals that can promote effective policy coherence and public-private-community partnerships at all levels. It is proposed that the discussions focus on three key, inter-related elements, as follows:

Policy coherence

- How can cross sectoral, multidisciplinary approaches at the national, regional and global levels be effected and prioritised?
- Which are key factors in facilitating policy, operational delivery environment and effectiveness for such approaches?
- What are relevant experiences and lessons learnt from existing projects and initiatives?
- What are the means to promote adoption of evidenced-based best practices and transferable lessons learned for policy coherence, including South-South approaches and strategies?

Effective partnerships

- What can we learn from existing PPC partnerships in terms of their contribution to the prevention, detection and response to infectious diseases?
- Are there experiences outside the health arena that are transferable?
- How can such partnerships be further strengthened?
- What are the right incentives for collaboration at different levels?
- What are the key considerations for ensuring the sustainability of PPC partnerships?

Evaluation and measuring success

- How can evaluation of PPC partnerships be undertaken?
- How do we measure success; e.g., what should be the matrix of success and effectiveness?
- Can there be evidence-based assessments of investments in innovation and R&D? And their eventual delivery in countries, including best practice, data and knowledge sharing?

Moderator

- **Tenu Avafia**, Team Leader, HIV, Health and Development Team, UNDP

Speakers

- **Mandeep Dhaliwal**, Director of HIV, Health and Development Team, UNDP
- **Hayato Urabe**, Director of Investment Strategy & Management, Global Health Innovative Technology (GHIT) Fund
- **Chalermsak Kittitrakul**, AIDS Access Thailand

Panelists

- **Yodi Mahendradhata**, Director, Center for Health Policy and Management, Universitas Gadjah Mada, Indonesia
- **Mwele Ntuli Malecela**, Director, WHO Regional Office for Africa
- **Richard Kock**, Professor of Wildlife Health and Emerging Diseases at the Royal Veterinary College, University of London, UK
- **Osman Dar**, Project Director, One Health Project, Centre on Global Health Security, London

Note: All speakers to be confirmed

PARALLEL SESSION 4.1 (PS4.1)

Moving Forward and Outward: Progress in Implementation of Global Frameworks and Initiatives

Background

Historically, international organizations, academia and others have provided regulations, standards or guidance to the global community (e.g., International Health Regulations, OIE Terrestrial Animal Health Code, and Codex Alimentarius). However, the challenge at all levels (i.e., globally, regionally, nationally and locally) has been in the actual implementation of these regulations, standards or guidance with the available resources and existing infrastructures. In response to requests from national authorities and as a result of breakdowns or delays in global, regional, national and local responses to emergent diseases, the global community has moved forward to develop frameworks and advance initiatives that further support national and local authorities in their efforts to prevent, detect and respond to human, animal and environmental health concerns. Critical to the utility and effectiveness of these frameworks and initiatives is the ability to build synergy among multiple stakeholder efforts and to address the needs of individual countries and communities.

Objectives

- To present a selection of global frameworks and initiatives, discuss the challenges and successes in their implementation and draw lessons to build sustainable, inclusive and effective preparedness and response systems.
- To discuss how these different global frameworks may (or may not) build upon each other or provide opportunities for synergies in supporting national and local capacity building efforts.

Moderator

- **Julie R. Sinclair**, CDC One Health Liaison to the OIE
- **Ronello C. Abila**, OIE SubRegional Representative for Southeast Asia

Panelists

- Development and implementation of the WHO's Joint External Evaluation (JEE) and role in implementation of the International Health Regulations and building national capacity (Mozambique as case study) – **Ali Ahmed Yahaya**, WHO
- OIE Performance of Veterinary Services (PVS) Missions and future course – **John Stratton**, OIE
- WHO Research and Development Blueprint – **Young-Mee YEE**, member of Advisory Group National of Health, Korea Centers for Disease Control and Prevention
- Global Rabies Initiative business plan – **Bernadette Abela-Ridder**, WHO

Note: All speakers to be confirmed

PARALLEL SESSION 4.2 (PS4.2)

Multi-sectoral Partnerships for Action on AMR

Background

Antimicrobial Resistance (AMR) respects no borders and has become an increasing threat to all countries - developed and developing alike. Common infections become untreatable, devastating infectious diseases become much more difficult to contain and standard medical procedures become a challenge. Thus, AMR has a major negative impact on growth and global economic stability. Given the breadth of impact from AMR, the only effective means to address AMR sustainably is through multisectoral action and partnership; however, challenges have been identified as to how stakeholders from different sectors can meaningfully come together to produce action and change. Innovative new approaches are needed to truly harness the potential of all people and perspectives, particularly those most vulnerable.

The UN Sustainable Development Goals (SDGs) recognize the importance of AMR (paragraph 26 of the Declaration). The attainment of many of them will depend on the availability of and access to affordable and effective antimicrobial medicines and other technologies such as diagnostic tests. AMR seriously threatens the health and lives of vulnerable populations, such as newborns, children, and women, as well as sustainable food and agriculture production and a healthy environment. AMR is reducing our ability to protect the health of animals and therefore is threatening safe and sustainable food and agriculture.

In a tripartite approach, WHO, the Food and Agriculture Organization (FAO) and the World Organization for Animal Health (OIE) recognize that addressing health risks at the human–animal-plant-ecosystems interfaces requires strong partnerships among entities that may have different perspectives and much work is currently ongoing.

On 21 September 2016, the President of the UN General Assembly convened a one-day high-level meeting at the UN Headquarters on AMR with the participation of Member States, non-governmental organizations, representatives of civil society, the private sector and academic institutions. The primary objective of the meeting was to summon and maintain strong national, regional and international political commitment in addressing AMR and the meeting emphasized the important role and responsibilities of governments, as well as the roles of non-State actors, the private sector and relevant inter-governmental organizations, particularly the WHO, FAO and OIE in establishing, implementing and sustaining a cooperative global, multi-sectoral and cross-sectoral approach.

Objectives

- How can the world come together to meaningfully and effectively address AMR in a sustainable way and in particular, engage non-traditional partners?
- Multisectoral partnerships have been identified as essential for addressing AMR – how can the world now move from planning to action at both the international and local levels?
- How does addressing AMR contribute to the attainment of the SDG's? How to effectively engage all relevant sectors: environment, food, employment, poverty reduction, agriculture, development partners, academia, private sector, etc.?
- How can the voice of all people be heard, particularly those marginalized and most vulnerable?
- What are the issues and opportunities around ensuring linkage between global and community/country-level partnerships? How can partnerships focus on possibilities for

meaningful collaboration, action on the ground and specific problems affecting communities rather than focusing only on the broader policy levels?

- What are some good practices and lessons learned from past multisectoral collaborations that could be applied to collaborations on AMR?

Moderator

- **Matthew Stone**, Deputy Director General, OIE

Panelists

- Civil society representative
  Arturo Quizhpe Peralta, Head, ReAct Latin America and Dean of the Faculty of Medical Science at University of Cuenca, Ecuador
  Stefano Nobile, Focal Point for Health, Caritas International, Vatican City
- Stakeholder perspective
  Maria Lettini, Director, FAIRR
- Country representative
  Ana Marie Garfin, National TB Control Program Manager, Department of Health, Phillippines
- WHO
  Marc Sprenger, Director of AMR Secretariat, WHO
- Representative from the interagency coordination group
  Jaana Husu-Kallio, Member of IACG, Permanent Secretary, Ministry of Agriculture and Forestry, Finland

Note: All speakers to be confirmed

PARALLEL SESSION 4.3 (PS4.3)

Community Systems: the Bedrock of Responses to EID and AMR

Background

Community preparedness and response to emerging infectious diseases (EID) and antimicrobial Resistance (AMR) is critical to the health outcomes of individuals. In HIV, people both living with and affected by HIV have been at the forefront of providing treatment preparedness to promote health-seeking behavior, improve adherence and other health outcomes, whilst advocating for increased availability, accessibility and uptake of key viral load diagnostics as well as 2nd and 3rd line antiretroviral therapy. In Malaria, civil societies work with other stakeholders to address artemisinin resistance in Southeast Asia via educating communities about the hazards of substandard drugs and organizing public awareness campaigns to complete a 3-day treatment course and on measures to prevent further spread of resistant pathogen strains. Similarly in tuberculosis, community-based outpatient treatment of MDR-TB in resource poor settings yield higher cure rates and facilitated better referrals to other health services required by TB affected communities. Furthermore, lessons learned from the early response to Ebola in West Africa have recognised the problem of sidelining community engagement as a key factor contributing to failure of the early emergency health programs to meet the needs and realities confronting affected populations in the region.

Today, prevention, detection and response to EID relies significantly on an effective surveillance system which starts at the community level with effective mechanisms in place to ensure linkage into national level health systems reporting. The Ebola crisis highlights the importance of integrated community case management (iCCM) and the roles of the network of community health workers and community leaders in early and better case reporting, contact tracing and bringing people into care, whilst reducing stigma and discrimination associated with the virus. Community-based control and preventive behaviours for vector control is recognized as a key pillar in disease response and preparedness for Zika and other mosquito-borne diseases. The use of innovative technologies in the response to EID by communities and community health workers contributed to the prompt control of the outbreak by providing a valuable platform for early warning and guiding early actions.

Objectives

The session aims to explore community roles in preparedness and response to EID and AMR, concentrating on lessons and approaches deployed in disease-specific programs, such as HIV, TB, Malaria, Ebola and Zika, whilst underscoring the importance of focusing on people, i.e. ensuring that systems for health involve the affected community and promotes community action as part of the overall health system critical for identifying, reporting and responding to emergency health threats.

The session is designed to generate discussions on commonalties and contexts of community action, and to reflect on emerging challenges that still persist in response to EID and AMR from the community perspectives, as well as to identify practical solutions drawing the lessons learned from community responses to the epidemics of HIV, TB, Malaria and to the most recent outbreaks of Ebola and Zika across the globe.

Moderator

- **RD Marte**, Asia Pacific Coalition of AIDS Service Organizations or Alessandra Nilo of GESTOS

Panelists

- **Othman Mellouk**, International Treatment Preparedness Coalition, HIV treatment advocate and educator, Morocco
- **Lina Kharn**, ARC Cambodia, Malaria Consortia, Cambodia
- **Anton Basenko**, Eastern Europe and Central Asia Network of People who Inject Drugs (ENPUD), Ukraine
- **Bhargavi Rao**, MSF-Holland, U.K
- **Alessandra Nilo**, GESTOS, Brazil
- **Abdulai Sesay**, Civil Society Movement Against Tuberculosis, Sierra Leone
- **Kannikar Kijtiwatchakul**, NHS Board member, Thailand

Note: All speakers to be confirmed

PARALLEL SESSION 4.4 (PS4.4)

Finding the Win-Win Solutions for Better Health from Better Food Systems

Background

The surging global demand for animal source foods and rapid growth rates in livestock and aquaculture production are being met with a range of approaches including both aggressive consolidations of production and marketing chains into intensive, large-scale commercial operations, as well as expansion of extensive, small- and medium-scale production systems. Most current approaches contain inherent vulnerabilities. How can the present food systems be reconfigured to feed the growing human population without leading to unintended health consequences for people, animals and the ecosystem? All the stakeholders in these food systems from production, marketing and consumption need to be actively involved in developing coherent and comprehensive approaches where almost everyone can benefit—i.e. collaborative win-win solutions.

Objectives

- Build upon the existing evidence base for the broad collateral benefits realized when longer term investments in shifting production toward reduced impact practices is achieved
- Review cases from the field of how these production shifts were achieved, the methodologies used in measuring the impact realized, and how the impacts were translated into advocacy efforts influencing policy and decision making
- Identify strategies for scaling up these approaches involving the critical stakeholders in a broad range of food systems based on animal production contexts

Moderator

- **Peter Black**, United Nations Food and Agriculture Organization

Speakers

- Farming organization representative representing small/medium size producers: **Andrey Susanto**, Indonesia
- Large producer: **Randal Giroux**, Cargill
- Consumer organization representative: **Niyada Kiatying-Angsulee**, Thailand
- Pharmaceutical industry representative: Elanco, **Kerry Keffaber**, Chief Veterinarian, Scientific Affairs and Policy.
- Knowledgeable Food Systems expert: **Robyn Alders**, University of Sydney, Australia.

Note: All speakers to be confirmed

PARALLEL SESSION 4.5 (PS4.5)

Bringing Solutions into Focus: Harnessing the Power of an Economic Lens

Background

Beyond the tragic loss of human life, the economic impact attributable to epidemics and pandemics can be catastrophic. SARS, $30 billion; Pandemic H1N1: $40 billion; Ebola: $2.8 billion in the three West African economies alone. Recent estimates place the inclusive costs from a moderately severe influenza pandemic at $570 billion annually, within the range projected for the annual cost associated with global climate change.[7] And, without intervention, the cumulative economic impact from anti-microbial resistance (AMR) through 2050 is projected to exceed $100 trillion (two-thirds of which is in low- and middle-income countries), substantially more than current annual global economic output.[8]

Despite a repeated pattern of costly response, the economic case for investing in proactive, preventive measures targeting a reduction in the pressures that facilitate disease emergence has not been widely adopted. A yearly investment of $1.9-3.4 billion to strengthen animal and human public health systems would yield a global public benefit estimated at over $30 billion annually through avoided economic damages associated with pandemics.[9] High return on investment is expected even if only a portion of pandemics are prevented, and strengthened One Health capacity in countries may confer additional benefits via improved prevention and control of endemic disease and AMR. However, challenges in mobilizing capital; an anemic evidence base and difficulty in translating evidence into policy advocacy with budget decision-makers; competing priorities for scarce health systems funding; and inequitable distribution of costs and benefits across sectors and stakeholders are all amongst the impediments to adopting the economic case for investing in preventive approaches.

Recent efforts designed to address these challenges have employed a range of approaches. Structures prioritizing risk avoidance and transference are being developed (e.g. multi-sectoral health security planning and capacity investments; epidemic/pandemic insurance structures). Also underway are new models capturing the economic impact of disease emergence as a function of land use, which will enable the disease regulatory role of ecosystems to be fairly valued and incorporated into payment for environmental services frameworks. And global financing structures promoting targeted, multi-sectoral systems strengthening and incentivizing investments in preparedness are being established.

[9] World Bank. People, Pathogens and Our Planet: Economics of One Health. 2012.

Objectives

- Highlight successful practices and approaches that have demonstrated promise in fostering decision making informed by economic analyses;
- Profile structures with proven utility in transcending the identified challenges, including resource prioritization and inequitable sectoral cost and benefit distribution;
- Discuss approaches that strengthen the economic evidence base for investments in proactive, preventive disease mitigation approaches; and
- Review policy and regulatory options, such as tax and incentive structures, that can contribute to a favorable investment environment for more wide scale adoption of risk mitigation approaches

Moderator

- **Dan Schar**, Regional Emerging Infectious Disease Advisor, USAID Regional Office

Panelists

- **Gavin Yamey**, Duke University Global Health Institute
  Introduction/overview; making the investment case for a preventive, One Health approach; challenges and opportunities in financing preparedness
- **Ramanan Laxminarayan**, The Center for Disease Dynamics, Economics, & Policy
  Global consumption of antimicrobials in animal production, costing antimicrobial growth promoter phase out, and catalyzing fit-for-purpose, enforceable AMU policies
- **Carlos Zambrana-Torrelio**, EcoHealth Alliance (A328)
  Analyzing the economics of disease emergence from deforestation to support better practices in the extractive industries and reduce pandemic risk
- **Nita Madhav**, Metabiota
  Catastrophe modeling and pandemic insurance: approaches to managing risk and incentivizing mitigation postures
- **Victoria Fan**, University of Hawai‘i at Mānoa.
  Expected economic losses from potentially vaccine preventable epidemics and pandemics

Subject: GBA Products and Action Items
Attachment(s): "GBA Executive Summary_rev2.docx","TORFTA_GBA_v14.docx","GBA_TORFTA Editing Form.xlsx"

Note: this email is best viewed in HTML

Greetings, GBA Steering Committee!

As promised we compiled a couple products and action items from our inaugural meeting on the 29th.

The All Partners Access Network (the site we will use for document sharing and editing) is live and the Executive Summary from our meeting, revised TORFTA, and TORFTA editing sheet have been uploaded. Here are the directions for access:

1. Go to www.apan.org
2. Click, “Create Account” (green button, upper right)
3. Use preferred work email and create password
4. Notify Will Sander once you have created your account; he will invite you to join the GBA SharePoint

For your ease, I have also attached the products that were hung on APAN:

1. An Executive Summary of the 29 June meeting for your files. This lists out key discussions, action items, and participants from the meeting.
2. Revised TORFTA (v14); **NOTE:** the plan for this document is to open a one week editing period for comments. If possible, edits and comments are due back NLT 31 July. After that, the official Version 1 of the GBA will be published.

Here are some requests that we have of you; if you have ideas on any or all of these items, please respond to this email:

1. We need suggestions for a next meeting and would like your suggestions; we will plan to release all options to the group in one week from now for vote. Here are some suggestions to get us started:
   a. International Congress on Pathogens at the Human and Animal Interface (ICOPHAI) 7-9 November 2017, Doha, Qatar https://icophai.org/
   b. Participatory Epidemiology Network for Animal and Public Health (PENAPH) – 10-12 January 2018, Chiang Mei, Thailand https://penaph.net/second-penaph-conference-participatory-approaches-in-animal-health-public-health-one-health-and-ecohealth/
   c. Others??
2. We need suggestions for Network names and would like your suggestions; we will plan to release the options to the group in one week from now for vote. Here are some suggestions to get us started:
   a. Global Alliance for Bat-borne Pathogens (GABP)
   b. Global Bat Pathogen Disease Network (GBPDN)
   c. Bat Alliance Trust Disease Network (BAT-DN)
   d. Others??
3. We need nominations for co-chairs, seek your suggestions; we will plan to release nominees in one week from now for vote.

MEETING OVERVIEW

BACKGROUND

In 2013, the Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) began leveraging, enhancing, and convening research networks to accelerate its programmatic and research driven targets and end states. CBEP uses this approach as a way to connect its active funded research projects with other projects to help influence effective change for global health security; translating data into policy. Further, by using relationship-based research networks around the globe, made up of interdisciplinary relationships, it will allow for novel and transformative scientific solutions for the world's largest infectious disease threats.

The Global Bat Alliance (GBA) is a CBEP research network that connects multidisciplinary and One Health expertise to address challenges and threats posed by bat-associated pathogens of security concern. The GBA maintains the standards of all research networks that are supported by CBEP, in which members convene as a body of experts and researchers to: (1) share information, data, samples, and protocols; (2) coordinate research activities; (3) build training events and awareness-building workshops at all levels of decision-making authority; (4) develop community standards and best research practices; (5) create mentorship-based opportunities for students, trainees, and early-career researchers to convene, present, and share ideas; (6) establish a community of international research leaders and champions; and (7) reduce outbreak / transmission risk.

Some of the world's most deadly emerging zoonotic diseases are found in bats, including Nipah, Hendra, and Marburg viruses. There are a number of factors which make bats unique disease reservoirs, including their social behavior, distinct physiology and metabolism, ability to travel long distances, nocturnal activity, species diversity, and long life span (10-20 years, compared with a rat's average life of two years).[1] These special bat characteristics, coupled with the impact of human mediated interactions and environmental changes, create research challenges to understanding the bat's role in the global zoonotic disease ecology, which is further complicated by being difficult animals to control within a typical laboratory setting. The GBA creates opportunities for policy makers, researchers, conservationists, funders, and students to identify community challenges, develop priority research lists and associated action plans that target needs and gaps, and work at all levels to build awareness of bat-associated disease burden and transmission risks to improve the prevention, detection, diagnosis, and reporting of pathogens of security concern.[2]

EXECUTIVE SUMMARY

On June 29, 2017, CBEP convened a group of multidisciplinary and One Health-focused research scientists, conservationists, and medical / veterinary practitioners for a one-day meeting in Fort Collins, Colorado to discuss organization and objectives for a bat-related research-based network (the complete agenda for the meeting may be found in Annex B). The representatives and experts in attendance work

[1] Hayman, David T.S., "As the bat flies," *Science* 02 Dec 2016: Vol. 354, Issue 6316, pp. 1099-1100 http://science.sciencemag.org/content/354/6316/1099

[2] Schountz, Tony, "Immunology of Bats and Their Viruses; Challenges and Opportunities," *Viruses,* 2014 Dec; 6(12): 4880-4901. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4276934/

in CBEP regions (a full list of participants may be found in Annex A). The meeting was held at the University Center for the Arts, at Colorado State University, in concurrence with the 2nd International Symposium on Infectious Diseases of Bats.

The meeting began with an introduction to CBEP's mission and its use of networks as a way to foster coordination across regions and build sustainable connections through research. The two CBEP science leads, Drs. Mary Lancaster and Marty Stokes, outlined their vision to enhance regional and global research capacity, which starts with a complete understanding of the existing research landscape. CBEP believes this approach mitigates duplication of effort, by working with and building off of existing relationships; this could include an amalgamation of individuals, institutions, or other communities of practice. The CBEP representatives emphasized that their broad objective is to fuse actively funded expertise and projects to better inform and drive global, regional, and national health security policies.

Following an introduction, the CBEP leads facilitated a conversation to build consensus on ways to organize and administrate the network through a Terms of Reference for Trusted Agents (TORFTA). A draft of the TORFTA was emailed to participants in advance of the meeting so the discussions were analytical and substantive. The meeting ended with notes for a new draft that participants agreed could be virtually edited via SharePoint.

The discussions regarding the TORFTA led to other discussions about the objectives for the network, which were revised in-real-time. The group agreed on the following objectives for the GBA:

- Facilitate interdisciplinary relationships and collaboration to identify research goals and needs for bat-associated disease research and disease threat reduction;
- Unify CBEP regions to create a common action plan that yields collaborative and sustainable projects that achieve the following end states: (1) better informed policy-makers; (2) better informed scientific community regarding funding targets and gaps in areas of research and development; (3) better defined threat to global health security from bat-associated pathogens; and (4) improved national, regional, and global capacity to detect and respond to pathogens of security concern; and
- Enable better communication, coordination, and outreach at the research and conservation interface.

The meeting ended with a thorough discussion about the research focus areas for the group. The meeting participants self-nominated into Working Groups to serve as research mentors (note: a list of working groups and mentors is outlined under the Research Focus Areas section of this document). The group agreed that discussions about priorities within the Working Groups should occur at the next steering committee meeting.

The first meeting of the GBA was a success. Participants readily took part in discussions and shared ideas from their respective multidisciplinary backgrounds. Many had experience forming similar research-based networks, and they appeared energized to solve global challenges related to spillover opportunity of bat-borne pathogens of security concern. While there were many unresolved topics of conversation (e.g., a new name for the network), the group agreed that they would communicate virtually on these subjects through email and SharePoint interaction, initiated by CBEP. They agreed to nominate and vote for individuals to serve as co-chairs of the Steering Committee as well as identifying an opportunity to meet again within the calendar year (note: a full list of outlying issues and recommendations for action may be found in the Action Items section of this document).

RESEARCH FOCUS AREAS

WORKING GROUP 1: HOST / PATHOGEN BIOLOGY AND INTERACTIONS

- Bat physiology and immunology
- Bat pathogen community biology (co-infections, co-morbidities)
- Distribution of pathogens among species

WORKING GROUP 1 RESEARCH MENTORS

- Dr. Joram Buza, Nelson Mandela African Institute of Science and Technology, Tanzania
- Dr. Vivek Kapur, Penn State University, U.S.
- Dr. DeeAnn Reeder, Bucknell University, U.S.

WORKING GROUP 2: PATHOGEN SURVEILLANCE, DIAGNOSTIC CAPACITY, AND EPIDEMIOLOGY

- Molecular epidemiology
- Distribution of pathogens geographically and phylogenetically
- Detection, diagnosis, and reporting of bat-associated pathogens

WORKING GROUP 2 RESEARCH MENTORS

- Dr. Catalino Demetria, Research Institute for Tropical Medicine, Philippines
- Dr. Jon Epstein, EcoHealth Alliance, U.S.
- Dr. Tamar Kutateladze, National Center for Disease Control and Public Health, Georgia
- Dr. Lela Urushadze, National Center for Disease Control and Public Health, Georgia
- Dr. Supaporn Wacharapluesadee, WHO CC for Research and Training in Viral Zoonoses, King Chulalongkorn Memorial Hospital, Thailand
- Dr. Abel Wade, National Veterinary Laboratory, Cameroon

WORKING GROUP 3: ECOLOGY SETTING (BAT, DOMESTICATED ANIMALS, AND WILDLIFE INTERFACE)

- Bat behavior, distribution, and movement
- Domesticated animals and wildlife behavior, distribution, and movement impact on interaction with bats.
- The effect of anthropogenic disturbance and modification

WORKING GROUP 3 RESEARCH MENTORS

- Dr. Paul Cryan, United States Geological Survey (USGS) Fort Collins Science Center, U.S.
- Dr. Tigga Kingston, Texas Tech University, U.S.
- Dr. Robert Kityo, Makerere University, Uganda
- Dr. Rebekah Kading, Colorado State University, U.S.

WORKING GROUP 4: HUMAN-BAT INTERACTIONS, RISK CHARACTERIZATION

- Hunting and commodity chain (e.g., bushmeat, guano, and pet trade)
- Ecotourism
- Interactions in human dwellings

WORKING GROUP 4 RESEARCH MENTORS

- Dr. Kevin Olival, EcoHealth Alliance, U.S.
- Dr. Ian Mendenhall, Duke/NUS, Singapore

ACTION ITEMS

The following Action Items were recorded and compiled by the organizational and administrative support staff of CBEP / Executive Committee for the GBA.

ACTION	APPROACH FOR COMPLETION WITH DATES	RESPONSIBLE AGENTS
Generate and send out options for new network name	(1) Send email to steering committee members soliciting options (with one week deadline) – 18 July (2) Preview options with Executive Committee – 25 July (3) Send all name options to group via polling application – 26 July	(1) Leahy (GSE) (2) Leahy (3) Leahy
Generate and send out solicitation for co-chair nominations	(4) Send request to steering committee members soliciting nominations (with one week deadline) in combination with the email from Task (1) (5) Preview options with EC – 25 July (6) Send all nominations to group for voting via polling application – 26 July	(4) Leahy (5) Leahy (6) Leahy
Generate and send out solicitation for next meeting conference opportunities and dates	(1) Send request to steering committee members soliciting nominations (with one week deadline) in combination with the email from Task (1) (2) Preview options with EC – 25 July (3) Send all nominations to group for voting via polling application – 26 July	(7) Leahy (8) Leahy (9) Leahy
Update TORFTA with recommendations from meeting	(4) Send invitation to steering committee members with editing options via APAN SharePoint – 19 July (5) Send Editing Form with above email – 19 July (6) Open editing period for one week – 19- 26 July (7) Collect comments and negotiate updates with EC 26-31 July	(10) Sander (CTR A&AS) (11) Sander (12) Sander (13) Sander / Leahy
Create CV Format for new members	(8) Create a CV Format (9) Upload to APAN	(14) Leahy (15) Sander
Finalize fact sheet	(10) Finalize fact sheet with updates from discussions (11) Send to PAO for review	(16) Leahy (17) Sander

ANNEX A – PARTICIPANTS

The following participants attended or were invited to attend the GBA Kickoff Meeting in Fort Collins, Colorado on 29 June 2017.

STEERING COMMITTEE MEETING INVITEES, DID ATTEND		
Kityo	Robert	Makerere University, Uganda
Mendenhall	Ian	Duke-NUS, Singapore
Buza	Joram	Nelson Mandela African Institute of Science and Technology (NM-AIST) (attended virtually)
Kapur	Vivek	Penn State University (attended virtually)
Olival	Kevin	EcoHealth Alliance
Epstein	Jonathan	EcoHealth Alliance
Kading	Rebekah	Colorado State University
Urushadze	Lela	National Center for Disease Control and Public Health (NCDC) Georgia
Kutateladze	Tamar	National Center for Disease Control and Public Health (NCDC) Georgia
Wacharapluesadee	Supaporn	WHO CC for Research and Training in Viral Zoonoses, King Chulalongkorn Momorial Hospital, Thailand
Wade	Abel	National Veterinary Laboratory of Cameroon (LANAVET)
Demetria	Catalino	RITM, Philippines
Kingston	Tigga	Texas Tech University
Cryan	Paul	USGS Fort Colliins Science Center
Reeder	DeeAnn	Bucknell University
INVITEES, DID NOT ATTEND		
Smith	Gavin	Duke-NUS, Singapore
Alhmoud	Nesreen	Royal Scientific Society
CBEP AND CBEP CONTRACTOR INVITEES, DID ATTEND		
Lancaster	Mary	DTRA CBEP
Stokes	Marty	DTRA CBEP
Gamboa	Omar	DTRA CBEP
Sander	Will	CTR A&AS Booz Allen
Leahy	Katie	GSE
Devaney	Caitlin	GSE

ANNEX B – MEETING AGENDA

The following agenda was set for the meeting. The majority of discussions focused on administration, organization, and focus of the network. The group did not get to the topics to prioritize research gaps and set action plans with short and long-term milestones and deliverables. Event facilitators organized questions and prompts for those sessions, which they will use for the next GBA meeting.

Time	Agenda Topic and Facilitator or Speaker	Expected Outcomes
0930 – 1000	**Welcome and Introductions**	
1000 – 1015	**Global Bat Alliance Overview** *Dr. Mary Lancaster (Africa Science Lead)* *Dr. Marty Stokes (SEA Science Lead, CBEP)*	• Review discussions leading up to this meeting • Discuss how this meeting is an opportunity to formalize the central / steering committee node for the distributed network • Emphasize that the steering committee shall focus on mentorship and connecting individuals and institutions across the globe
1015 – 1045	**Review Charter and Move to Agreement** *TBD*	• Vote to accept organizational document for steering committee • Unanimous (??) acceptance • We will advertise intent ahead of meeting • We will convene a meeting on 7 June to review and discuss the draft TORFTA
1045 – 1115	**Identify and discuss research focus areas** *TBD*	• Group will identify and discuss overarching focus areas and sub focus areas • Steering committee and invitees shall self nominate to groups and agree to serve as research mentors for the groups
1115 – 1230	**Breakout: Prioritize research needs and gaps** *TBD*	• Group will breakout into their research focus areas and begin identifying needs and gaps • Groups will then work to prioritize their lists
1230 – 1330	**Working Lunch** *TBD*	• Buffett • Convene back as a group, hold discussions about the overarching objectives of the alliance • Discuss One Health and Vector-based International meetings as an opportunity to re-convene semi-annually

1330 – 1400	**Breakout: Draft timelines and workplans** *TBD*	• Begin drafting short and long-term timelines and workplans for each focus area • Short-term milestones could include identifying key researchers and networks • Long-term milestones could include training events and focus area meetings
1400 – 1430	**Closing / review of actions** *TBD*	• Close-out meeting / 5min brief out for each group (2 slides) • Review action items and next steps

TERMS OF REFERENCE FOR TRUSTED AGENTS OF THE GLOBAL BAT ALLIANCE

1. BACKGROUND

In 2013, the Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) began leveraging, enhancing, and convening research networks to accelerate its programmatic and research driven targets and end states. CBEP uses this approach as a way to connect its active funded research projects with other projects to help influence effective change for global health security; translating data into policy. Further, by using relationship-based research networks around the globe, made up of interdisciplinary relationships, it will allow for novel and transformative scientific solutions for the world's largest infectious disease threats.

The Global Bat Alliance (GBA) is a CBEP research network that connects multidisciplinary and One Health expertise to address challenges and threats posed by bat-associated pathogens of security concern. The GBA maintains the standards of all research networks that are supported by CBEP, in which members convene as a body of experts and researchers to: (1) share information, data, samples, and protocols; (2) coordinate research activities; (3) build training events and awareness-building workshops at all levels of decision-making authority; (4) develop community standards and best research practices; (5) create mentorship-based opportunities for students, trainees, and early-career researchers to convene, present, and share ideas; (6) establish a community of international research leaders and champions; and (7) reduce outbreak / transmission risk.

Some of the world's most deadly emerging zoonotic diseases are found in bats, including Nipah, Hendra, and Marburg viruses. There are a number of factors which make bats unique disease reservoirs, including their social behavior, distinct physiology and metabolism, ability to travel long distances, nocturnal activity, species diversity, and long life span (10-20 years, compared with a rat's average life of two years).[1] These special bat characteristics, coupled with the impact of human mediated interactions and environmental changes, create research challenges to understanding the bat's role in the global zoonotic disease ecology, which is further complicated by being difficult animals to control within a typical laboratory setting. The GBA creates opportunities for policy makers, researchers, conservationists, funders, and students to identify community challenges, develop priority research lists and associated action plans that target needs and gaps, and work at all levels to build awareness of bat-associated disease burden and transmission risks to improve the prevention, detection, diagnosis, and reporting of pathogens of security concern.[2]

2. GBA MISSION AND VISION

The GBA brings together a multidisciplinary and One Health-focused group of scientists, policy makers, research scientists, and medical/veterinary practitioners with interests in bat-related research involving pathogens of security concern. The network builds on community standards and best practices for research. The GBA identifies and shares information on research funding opportunities offered by multiple institutions. Most importantly, this network fosters international relationships among

[1] Hayman, David T.S., "As the bat flies," *Science* 02 Dec 2016: Vol. 354, Issue 6316, pp. 1099-1100 http://science.sciencemag.org/content/354/6316/1099

[2] Schountz, Tony, "Immunology of Bats and Their Viruses; Challenges and Opportunities," *Viruses,* 2014 Dec; 6(12): 4880-4901. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4276934/

collaborators, agencies, and organizations, which can produce long-term, sustainable partnerships that withstand changes in government and organization budgets, priorities, postures, and policies.

All members, or "Trusted Agents" of the Alliance play a role in operationalizing the objectives of the GBA, strengthening linkages and reducing overlap in global research on high-priority pathogens of bats (especially zoonoses) to maximize the efficient use of expertise and resources and accelerate the coordinated development of better disease surveillance and control methods.

3. OBJECTIVES

CBEP created a standard framework of objectives that it uses for its research networks, which is outlined in the Background Section of this document. The specific, research-focused objectives of the GBA are as follows:

- Facilitate interdisciplinary relationships and collaboration to identify research goals and needs for bat-associated disease research and disease threat reduction; and
- Unify CBEP regions to create a common action plan that yields collaborative and sustainable projects that achieve the following end states: (1) better informed policy-makers; (2) better informed scientific community regarding funding targets and gaps in areas of research and development; (3) better defined threat to global health security from bat-associated pathogens; and (4) improved national, regional, and global capacity to detect and respond to pathogens of security concern
- Enable better communication, coordination, and outreach at the research and conservation interface

4. APPROACH

The Terms of Reference for Trusted Agents (TORFTA) establishes ground rules and responsibilities for all members – known heretofore as "Trusted Agents" (TAs) of the GBA. The leadership structure of the GBA is made up of subject matter experts who serve as mentors and function as independent, trusted advisors and honest brokers for research within the GBA.

All TAs function within an organizational structure that consists of an Executive Committee (EC), a Steering Committee (SC), and four subject matter-focused Working Group (WG) subcommittees. The GBA employs a bottom-up design. This is an organizational approach that encourages ideas, solutions, and projects to start with TAs within the WGs. The ideas, solutions, and projects will filter through the WG mentors, who then link people, ideas, solutions, and projects together at the SC level; ultimately, this approach will (1) foster lasting relationships at an individual or institutional level, and (2) yield better data outcomes and/or larger fields of study. A visual representation of the responsibilities and organizational flow of the GBA is found in Figure 1.

Roles and responsibilities of the TAs within Committees and Working Groups are as follows:

4.1 Working Groups (WGs)

The WGs serve as subdivisions of the GBA designed to foster multinational and multidisciplinary participation and meet the wide spanning research challenges associated with bat-borne diseases. TAs from the SC serve as research mentors and subject matter experts within each WG, providing guidance on projects.

There are limited barriers to entry for becoming a TA in the GBA and joining a WG. Non-steering committee members should work or reside in CBEP engaged countries, which can be found in Annex B, and may be students, entry to mid-level career professionals, or anyone interested in

contributing to the bat research community. Entry for indviduals who do not work or reside in CBEP engaged countries will be considered by the EC on a case-by-case basis. Non-steering committee TAs do not have term limits, but are encouraged to collaborate, contribute, and participate evenly across the WGs. TAs receive invitation or nomination to participate in a WG by members of the EC or SC.

The WGs focus on the following research areas *(**note:** these focus areas were agreed upon at the GBA kickoff in Fort Collins, CO 29 June 2017*):

Working Group 1: Host / pathogen biology and interactions; specifically:

1. Bat physiology and immunology
2. Bat pathogen community biology (co-infections, co-morbidities)
3. Distribution of pathogens among species

Working Group 2: Pathogen surveillance, diagnostic capacity, and epidemiology; specifically:

1. Molecular epidemiology
2. Distribution of pathogens geographically and phylogenetically
3. Detection, diagnosis, and reporting of bat-associated pathogens

Working Group 3: Ecology setting (bat, domesticated animals, and wildlife interface); specifically:

1. Bat behavior, distribution, and movement
2. Domesticated animals and wildlife behavior, distribution, and movement impact on interaction with bats.
3. The effect of anthropogenic disturbance and modification

Working Group 4: Human-bat interactions; specifically:

1. Human behavioral risk characterization
2. Hunting and commodity chain (e.g., bushmeat, guano, and pet trade)
3. Ecotourism
4. Interactions in human dwellings

4.2 Steering Committee (SC)

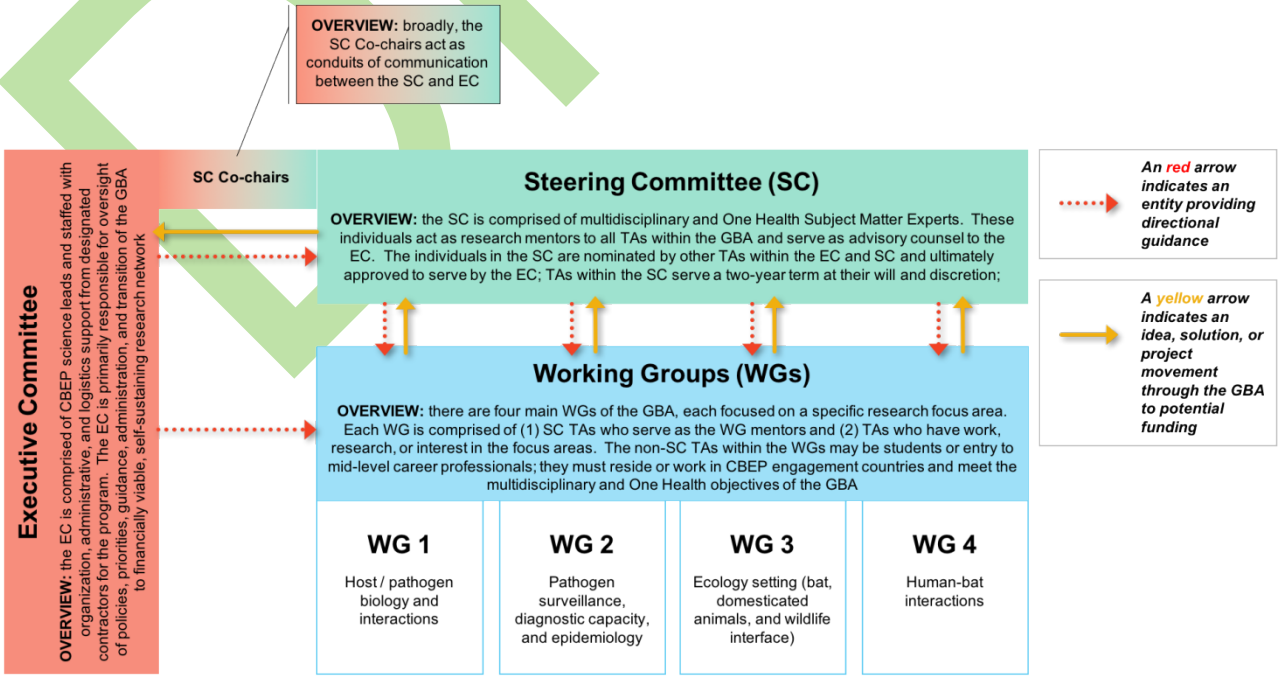
The SC includes multidisciplinary subject matter experts. They fill two important roles to operationalize the objectives of the GBA, (1) acting as advisory counsel to the EC for global bat research (providing analysis of research gaps and needs and priority targets for future funds) and (2) serving as scientific mentors within WGs.

TAs within the SC advise on the scientific merit of proposals to the EC and assist with implementation per TORFTA guidance and EC direction. The selection process for SC membership gathers a multidisciplinary body of global representation, both geographically and across the bat research spectrum. Two SC Co-chairs are elected to serve as communication between the SC and EC. Their roles and responsibilities are outlined in more detail later in this section.

TAs are nominated to join the SC by active members of the SC and EC. The inaugural SC was gathered together by the EC on 29 June 2017 in Fort Collins, Colorado. There is a two-year term limit for a TA in the SC, however, they have the option to leave and nominate a replacement at any time and with sufficient notification to the SC Co-chairs.

The SC is responsible for the following items (at a minimum):

- Act as a scientific coordinating body for the GBA
- Consider and provide analysis on the scientific merit of proposals at the direction of the EC
- Serve as subject matter experts and research mentors for implementation of accepted GBA-endorsed projects
- Work within WGs to gather information on challenges, and propose research priorities to EC
- Identify possible conflicts of interest and make recommendations to SC Co-chairs and EC (e.g., one solution might be a temporary hiatus from the GBA or from service on the SC for a period of time)
- Annually review and make recommendations on policy and guidance of the GBA, which could include revision of the objectives, terms of reference, terms for membership, or structure of the GBA
- Work with the EC to determine challenges for transition to a self-sustaining network, which could include sources and means of political and financial support
- Define objectives, schedules, milestones, and deliverables of the WGs, as well as identifying need for proposing establishment of new or closing-out existing WGs
- Support WGs in organizing gap analyses and research prioritization
- Promote interactions between WGs
- Assess and report progress of the WGs to other members of the SC and EC
- Develop and encourage exchange of protocols and best practices, and agree on standard operating procedures, good research practice, and roadmap to reach GBA goals (short and long-term)
- Establish compliance rules for ethical practice, create training SOP



NOTE: *CBEP considers all contributors and participants of the GBA as "members" of the network; designating the term "Trusted Agents" (TAs) to all individuals regardless of role, affiliation, seniority, or responsibilities*

FIGURE 1 ORGANIZATIONAL STRUCTURE AND RESPONSIBILITIES OF THE GBA

SC Co-chairs: Two members of the SC are chosen by majority voting during annual meeting of the EC and SC. All other TAs on the SC have two-year term limits; however, the Co-chairs hold one-year term limits. These two individuals serve as the communication node between the EC and SC. They engage with the WG mentors that serve on the SC from the bottom-up, to identify candidates and projects. Other responsibilities include:

- Coordinate with EC organization and administration staff to arrange meeting schedule for EC/SC (virtual and in-person)
- Identify opportunities to broaden the network, e.g., conference attendance, paper presentations, etc.
- Communicate EC requirements to SC and set standards for good management practices within WGs
    - Reports
    - Schedules
    - Membership distribution
    - Information flow
- Communicate EC requirements to SC and set standards for good management practices within WGs
- At the direction of the EC, act as a spokesperson for the network and interact with complimentary fields of study outside the network
- Work with the EC to determine and seek other funding opportunities
- Communicate regularly with EC on potential risks to self-sustainability of the network
- Advise the EC on potential conflicts of interest and recommended courses of action

4.3 Executive Committee (EC)

The EC ultimately sets policy and guidance for the GBA. It is chaired by the CBEP Science Leads from Africa and Southeast Asia and staffed with organization, administrative, and logistics support from designated contractors assigned to the program. The EC is primarily responsible for oversight of GBA governance policies and guidelines, which includes funding decisions, research priorities, adjudication of potential conflicts of interest, and GBA membership at all levels of participation. As such, the EC is the sole decision-making body of the research network for funding.

The EC is comprised of members from the CBEP Research Program, therefore, the details regarding program requirements and processes for funding can be found in Annex A of this document and should be used as a resource for all GBA Trusted Agents who wish to submit projects to CBEP.

The EC and their team are broadly responsible for the following tasks (at a minimum):

- Review and approve objectives and goals for the GBA
- Review and approve Steering Committee and Working Group schedules and deliverables
- Provide organizational, administrative, and logistics support for meetings, conferences, and training events (virtual and in-person) of the GBA SC and WGs

- Work with Chairman and Deputy Chairman of the SC on marketing, communication, and outreach with other experts, fields of study, policy makers, international organizations, non-governmental organizations, and other networks
- Disseminate network information to all TAs, which could include newsletters, website links, press releases, and dates for upcoming meetings and conferences (inside and outside the network)
- Build connections with other funding agencies and organizations
- Convene a bi-annual research review for four focus areas of the network
- Measure network performance goals
- Score indicators of network transition to self-sustainability readiness

5. GOVERNANCE AND MEMBERSHIP

5.1 Accountability

The overarching duty of the GBA is to develop multi-disciplinary and multi-national, hypothesis driven, research projects and training opportunities that meet the prioritized challenges defined by the EC under advice from the SC with the goal of outlining community standards of practice. All TAs are accountable for the following:

- TAs must be familiar with the TORFTA and the mandate of the committees or WGs on which they serve
- TAs must promote a culture of responsible practice for scientific research
- TAs must work towards the short and long-term goals for the benefit of the GBA with a particular emphasis on the foci that fall within their WG
- TAs on the SC are selected for their breadth of experience, insight and knowledge, integrity and character, and sound and independent judgment; therefore, they are expected to bring these personal qualities to their role on the SC and apply impartial judgment to help the EC make informed and independent decisions

5.2 Conflicts of Interest

The TORFTA document chooses the National Academy of Sciences (NAS) definition of Conflict of Interest: “a conflict of interest in research exists when the individual has interests in the outcome of the research that may lead to a personal advantage and that might therefore, in actuality or appearance compromise the integrity of the research.”

No member of the Steering Committee may participate in a discussion where such participation would give rise to a potential conflict of interest. As defined in section 4.1, the EC shall review all situations and decisions insofar as a financial obligation is at stake. SC members may leave their term of service on the SC if they wish to participate in a funding opportunity that would otherwise be perceived as a conflict of interest. SC TAs must recuse themselves if any personal advantage, not just those of financial benefit, is perceived. Any member of the SC may discuss possible conflicts of interest with the EC before recusing themselves or stepping down from their term of service.

The EC arbitrates final decisions regarding potential conflicts of interest. With advice from the SC Co-chairs, they will determine if a recusal, resignation, or termination is required. The EC will determine the terms of recusal on a case-by-case basis, which could include being directed to

abstain from any or all of the following: (1) meetings; (2) votes; (3) exchange of information; or (4) other correspondence. Ultimately, the EC advocates for complete transparency within the GBA, with an emphasis on early and frequent communication about any matter that could be perceived as a conflict of interest; this approach will mitigate ethics concerns and should eliminate the need for termination of service.

5.3 Selecting **TAs**

As stated in previous sections, all members of the GBA are referred to as "Trusted Agents" (TAs) of the network. TAs must reflect the One Health, multi-disciplinary, and multi-national nature of the GBA. There are no term limits for non-committee associated TAs, who are allowed to participate at will in accordance with terms of the TORFTA, additional selection rules are as follows:

5.3.1 ***Terms of service –*** *none*

5.3.2 ***Eligibility*** *– representation from each CBEP region must be maintained*

5.3.3 ***Nomination process –*** *nominated or invited to participate by the EC or SC at conferences, meetings, or electronically*

5.3.4 ***Selection process –*** *reviewed by members of the EC under advisement of the SC*

5.4 Selecting SC TAs

The SC includes TAs that are regarded as subject matter experts in their fields of research. TAs of the SC agree to the following rules for selection:

5.3.5 ***Terms of service –*** *2 years, no term limit*

5.3.6 ***Eligibility*** *– representation from each CBEP region must be maintained*

5.3.7 ***Nomination process –*** *nominated biennially (or as needed or requested by EC and SC Co-chairs); nomination process takes place in-person or virtually, selection is achieved through majority vote*

5.3.8 ***Selection process –*** *upon nomination, potential applicant will submit an application, which will be reviewed for relevancy by members of the EC and SC Co-chairs*

5.5 Consensus

A quorum within the GBA is constituted by 2/3 approval within the SC, and rounded up when the number is uneven. The SC may decide by consensus or majority vote to ask other TAs to join a meeting to exchange information, material, or knowledge. The SC may establish sub-committees consisting of three or more of its members to conduct training or outreach (or any effort not explicitly within the stated focus areas of the SC and WGs). However, the Co-chairs should be informed of these efforts to communicate the need and seek approval from the EC.

ANNEX A: APPLYING FOR FUNDING VIA EXECUTIVE COMMITTEE / CBEP

A.1 CBEP Research Scope

In order for CBEP to remain relevant, agile, and sustainable, research projects must be aimed at threat reduction objectives and demonstrate a clear nexus with the biosurveillance mission. The scope of CBEP research priorities include (but are not limited to):

- Understanding the ecology and epidemiology of pathogens of security concern, including HHS and USDA Biological Select Agents and Toxins and pathogens of pandemic potential, emerging, and re-emerging infectious diseases (e.g., avian influenza [low and highly pathogenic], African swine fever, Middle East Respiratory Syndrome (MERS), Ebola)
- Differentiating infectious diseases presenting clinical signs and symptoms similar to those of pathogens of security concern (e.g., influenza-like illness, acute febrile illness, fever of unknown origin)

CBEP will not support research projects that have no clear link to its threat reduction mission, are not sustainable for the partner country, or propose activities constituting Dual Use Research of Concern. These and other requirements and constraints are outlined in the figure below.

CBEP Fundamental Research Scope	
In Scope	**Out of Scope**

Projects that demonstrate:
• Clear relationships to pathogens of security concern
  ○ U.S. Biological Select Agents *
  ○ Pathogens of pandemic potential
  ○ Pathogens with potential to be weaponized
  ○ Emerging or re-emerging infectious diseases
  ○ Differentiating pathogens of security concern from agents with similar clinical signs and symptoms
• Links to threat reduction mission
• Support of BS&S and biosurveillance capabilities that reduce the threat of pathogens of security concern
  ○ Rapid, accurate, and safe detection, diagnoses, and reporting
• Alignment with both CBEP and partner country infectious disease priorities
• Use of sustainable techniques, procedures, and approaches in appropriate facilities
	Projects that focus on:
	• Dual-Use Research of Concern (DURC)
	• Diagnostic assay / novel technology
	• Development **
	• Medical countermeasures, including vaccine development
	• Non-infectious diseases
	
	Projects that contain:
	• Establishment of new pathogen repositories
	• No link to pathogens of security concern
	• No clear alignment to threat reduction mission
	• Use of unsustainable techniques, procedures, or inappropriate facilities
	  ○ Requires use of supplies or resources not available in country

	• No clear research question or hypothesis • No potential to generate knowledge that may result in scientific publications

* Pathogens on the HHS and USDA Biological Select Agent and Toxins List

** Field or country-specific validation of new diagnostic assays, novel technologies or equipment may be in scope if meeting other in-scope criteria

A.2 Applying for DTRA CBEP Research Funding

CBEP Research Objectives and Scope

DTRA CBEP is continuously seeking new collaborators, partners and international partners to conduct cooperative biological research to inform and enhance disease surveillance and global health security. Projects that are hypothesis-driven and contain substantive engagement with and contribution by partner country governments, institutions and scientists are appropriate for CBEP research funding. Research projects that support CBEP objectives in partner countries include those that promote One Health, improve disease surveillance, enhance understanding of endemic pathogens, explore the microbial ecology of endemic organisms, and enhance host country capabilities in support of World Health Organization International Health Regulations and World Organization for Animal Health reporting standards. Pathogens of interest include Biological Select Agents and Toxins, pathogens of pandemic potential, pathogens with the potential to be weaponized, emerging and re-emerging infectious diseases, and pathogens that are co-syndromic with associated select agent etiologies such as Influenza-Like Illness or Acute Febrile Illness. CBEP does not support research topics that involve Dual- Use Research of Concern or focus on disease agents that are sexually transmitted, non-infectious, or do not pose a threat to global health security.

Research projects supported by CBEP must align with CBEP's overarching goals to reduce the threat to U.S. and global health security and are expected to produce results suitable for scientific publication.

Applying to the Broad Agency Announcement (BAA) and Government Call

CBEP welcomes research funding applications from domestic and foreign academic, private, and government institutions, and has multiple solicitations available for proposals.

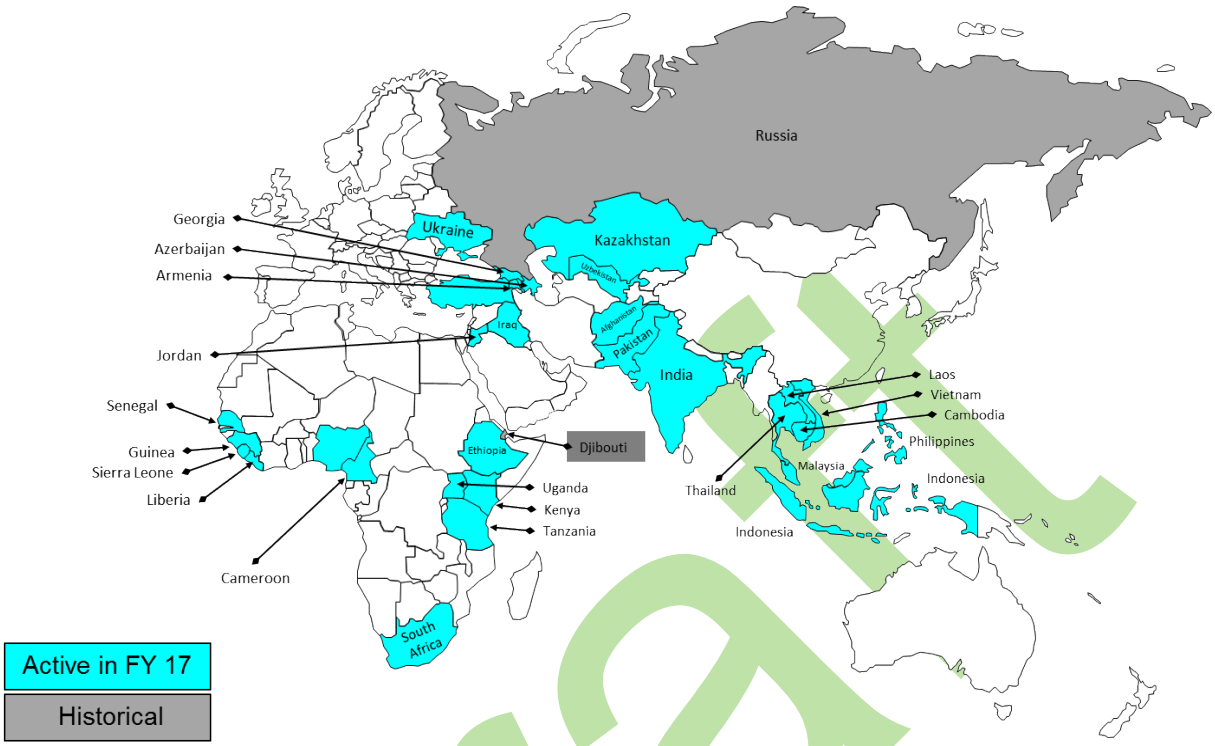
- Academic institutions, non-governmental organizations, industry, foreign laboratory equivalents, and members of the private sector must apply through Thrust Area 6: Cooperative Counter Weapons of Mass Destruction (CWMD) Research with Global Partners of the Fundamental Research to Counter Weapons of Mass Destruction (FRCWMD) – BAA (HDTRA1-14-24- FRCWMD-BAA).
- U.S. Government partners and Federally Funded Research and Development Centers (FFRDCs) must apply through Thrust Area 6 of the FRCWMD Government Call (HDTRA1-12-17- FRCWMD-Call).

All research ideas MUST be pre-coordinated through submission of an abstract to HDTRA1-FRCWMD-TA6@mail.mil prior to submitting a white paper. White papers (aka Phase I proposal) must be submitted and a full proposal (aka Phase 2 Proposal) invited prior to submission of a full proposal. Phase 1 and

Phase 2 proposals to the FRCWMD-BAA must be submitted through www.grants.gov. Phase 1 and Phase 2 proposals to the FRCWMD-Call must be submitted through www.dtrasubmission.net. White papers and proposals will be peer reviewed in accordance with the evaluation criteria published in the BAA and Call and in coordination with appropriate CBEP Regional and Country Managers. To be successful, a white paper and/or proposal must align with both the DTRA/SCC-WMD CBEP mission and regional priorities.

Detailed instructions for the FRCWMD-BAA and the FRCWMD-Call can be found through the solicitation links at www.dtrasubmission.net. Please ensure that you are downloading and reviewing the latest amended full announcement for the most accurate information and instructions. Offerors may submit questions of an administrative nature for BAA to HDTRA1-FRCWMD-A@mail.mil or for Service Call to HDTRA1-FRCWMD-C@mail.mil.

ANNEX B: CBEP ENGAGEMENT COUNTRIES



From: Katie Leahy >

Subject: GBA Update and Request

All,

On behalf of Dr. Mary Lancaster and Dr. Marty Stokes, we would like to thank everyone, for your responses over the last couple weeks! Based on your feedback, we have a few announcements and one request:

Based on committee consensus, the group chose our next event to coincide with the Participatory Epidemiology Network for Animal and Public Health (PENAPH) on 10-12 January 2018, in Khon Kaen, Thailand. Details will be forthcoming, but please visit the hyperlink for further information (https://penaph.net/second-penaph-conference-participatory-approaches-in-animal-health-public-health-one-health-and-ecohealth/).

We did not receive additional nominations to serve as co-chairs, so we are pleased to announce our first Steering Committee Co-chairs: Dr. Jon Epstein from EcoHealth Alliance and Dr. Vivek Kapur from Penn State University. We will be setting up coordination calls with our two co-chairs, so you can expect communication and direction from them in the future.

Finally, one request; we did not have a majority vote selection for our organization's name, which leaves us with two options:

Option 1 Bat-associated Pathogen and Ecology Research Network (BPERN) and

Option 2 Global Alliance for Bat-borne Pathogens (GABP).

Please respond to this email with your selection no later than 24 August. We will tally the votes and make an announcement thereafter.

Thank you, again, for signing up to the APAN site and being so responsive to the request. We will be loading the first documents and drafts to the site (e.g., the TORFTA and community fact sheet) in the next couple weeks. You may expect email from us with information concerning our next meeting in January and planning discussions leading up to that meeting.

V/r,

Katie Leahy

Subject: Global Bat Alliance Follow-up
Attachment(s): "GBA Database[1].xlsx"

All,

As a follow-up to last week's GBA call, please find a very rough draft spreadsheet of the information we have collected for the GBA. Please take a look and modify or add to the list as needed.

We are in the process of updating the Terms of Reference and will get a second draft of that out to the group in the next day.

V/r,

Katie Leahy

1	Title	Website	Location	Mission
2	African Bat Conservation (ABC)	http://www.africanbatconservation.org	Africa (Malawi)	ABC conducts applied research, conservation, and education to bring bats the conservation agenda and conserve bats in Africa.
3	Bats Without Borders	http://www.batswithoutborders.org	Africa (Namibia, Botswana, South Africa)	Bats Without Borders aims to support research and conservation action, community engagement, and capacity building that contribute to the conservation of southern African bats
4	Health for Animals and Livelihood Improvement (HALI) Project	http://haliproject.org	Africa (Tanzania)	The HALI Project is a collaborative research and capacity building program investigating health at human-animal-environment interfaces in Tanzania. HALI is an international team of researchers, professionals, students, volunteers, and community members working together to better understand the interactions among humans, animals, and their shared environments in Tanzania.
5	Bat Conservation Trust	http://www.bats.org.uk/index.php	Europe (London)	The Bat Conservation Trust supports over 100 local bat groups and 6000 members and works with volunteers, scientists, industry and government both locally and nationally on a range of projects.
6	North American Society for Bat Research (NASBR)	https://www.nasbr.org	North America	NASBR promotes the study and conservation of bats by facilitating communication and collaboration among scientists, educators, and the general public. The society holds an annual meeting called the North American Symposium on Bat Research.
7	Indian Bat Conservation Research Unit (IBCRU)	http://ibcru.org	South Asia (India)	IBCRU is established to provide an organization support for Bat research, conservation, capacity building and outreach in India. It aims to prepare a detailed database on bat ecology in the country.
8	Southeast Asian Bat Conservation Research Unit	http://www.seabcru.org	Southeast Asia	SEABCRU gathers people with existing expertise to share experiences among and countries, refine research and protocols that can lead to integration and synthesis across the region, and link research processes and outputs with conservation effects.
9	Center for International Forestry Research (CIFOR) Bushmeat Research Initiative (BRI)	http://www.cifor.org/bushmeat/	Southeast Asia (Indonesia)	BRI brings together diverse researchers and practitioners to generate and share knowledge on bushmeat harvesting, marketing, and consumption across Latin America, Africa, and Asia. BRI and partner scientists work to strengthen the evidence base for effective interventions and to identify knowledge gaps and main areas where further work is required.
10	Bat Conservation International (BCI)	http://www.batcon.org	USA (headquartered in Austin, Texas and Washington, D.C.)	BCI's mission is to conserve the world's bats and their ecosystems to ensure a healthy planet. The organization conducts work in Africa, Asia, Latin America, Oceania, and USA-Canada regions.

1	Title	Author	Publish Date	Summary Review
2	"Bat Astroviruses: Towards Understanding the Transition Dynamics of a Neglected Virus Family	Kerstin Fischer	17-Feb-17	This article overviews current findings regarding Astroviruses in bats, humans, and livestock. Since 2008, a growing number of bat species have been found to carry Astroviruses with a noticeable prevalence and diversity. Fischer calls for virologists, bat ecologists, and zoologists to create an interdisciplinary research environment for Astroviruses, specially those transmitted by bats.
3	Identification of a Lineage D Betacoronavirus in Cave Nectar Bats in Singapore and an Overview of Lineage D Reservoir Ecology in SE Asian Bats"	Ian Mendenhall	16-Sep-16	Bats are reservoirs for several different coronaviruses that lead to SARS and MERS outbreaks. This article examined bat urine and feces to look for coronavirus sequences in six species of bats. They found a new strain closely related to D Betacoronavirus. The study helped scientists better understand coronavirus evolution and host specificity.
4	Flavivirus Infections of Bats: Potential Role in Zika Virus Ecology"	Rebekah Kading	22-Aug-16	Kading studies bats with flaviviruses as vectors contributing to emerging viruses in human populations and the potential role of bats in the sylvatic transmission of Zika virus.
5	"Optimizing Viral Discovery in Bats"	Cristin Young, Dr. Kevin Olival	11-Feb-16	This article synthesizes the published data from 2007-2013 on viral discovery studies in bats. They specifically examine factors that increase success of viral discovery in bats while also studying particular trends and patterns of infection across host taxa and viral families. They found that detection methods have changed, with a decrease in serological assays such as ELISA, and an increase in the use of molecular methods, primarily PCR. Lethal sampling does not appear to increase success in obtaining positive viral detection. Viral prevalence and detection vary by specimen type and host taxonomy, therefore increasing the number of bat species sampled is likely to increases the number of viruses found.
6	Molecular evidence of Ebola Reston virus infection in Philippine bats	Tom Hughes	17-Jul-15	This article provides the results of a surveillance mission conducted in order to gather evidence of Ebola Reston virus in Philippine Bats. The team surveyed multiple locations across the country and used serology as well as molecular assays to test for infections. In all, 464 Bats representing 21 different species were captured and tested. Of the samples captured and tested in Bulatan, all sera were negative, and all swabs were negative. 5 oropharyngeal swabs produced potentially positive results, with 3 full positive (all positive results came from the same species Miniopterus schreibersii). The samples showed a close relationship to sequences found in Philippine pigs, off by one single nucleotide. This relationship poses a serious risk due to recent discovery of Ebola in Chinese pigs. The team concluded that Ebola virus infection is taxonomically widespread in Philippine bats, but more surveillance needs to be conducted in order to pin down specific geographic regions and specific species.
7	"Detection of Entebbe Bat Virus After 54 Years"	Rebekah Kading, Robert Kityo	8-May-15	Kading and Kityo studied the evolution of the Entebbe (ENTV) bat virus from 1957 to 2011 to determine ecological and genetic factors influencing the evolution and transmission of bat and mosquito borne flaviviruses. They created a maximum likelihood tree based on nucleotide frame sequencing. Studying the patterns and evolution of ENTV may provide insight into the ecological and genetic factors influencing the evolution and transmission of other bat-borne and mosquito-borne flaviviruses.
8	"Characteristics and Risk Perceptions of Ghanaians Potentially Exposed to Bat-Borne Zoonoses through Bushmeat"	Alexandra Kamins, J Rowcliffe	30-Sep-14	The authors interviewed 577 Ghanaians to identify the characteristics of bat hunters and consumers, and the perceived risk of people involved in the bat-bushmeat trade. Interviewees held little belief of disease risk from bats and the authors found notable discrepancies between stated preference and reported behaviors. Identifying gaps in perceived risk and actual risk can inform management plans and draw on social context and gender roles to best mitigate the spread of disease. It also allows for targeted education initiatives to correct misconceptions about demand and risk associated with bat meat.
9	"Filoviruses in Bats: Current Knowledge and Future Directions"	Kevin Olival, David Hayman	17-Apr-14	Olival and Hayman review the ecology, epidemiology, and natural history of Filoviruses, specifically Ebolavirus and Marburgvirus. They conclude by emphasizing the need for unified, global surveillance for filo viruses in wildlife and advocate for more multi-disciplinary approach to understand the dynamics in bat populations that lead to outbreaks.

10	Foraging Behaviour and Landscape Utilisation by the Endangered Golden-Crowned Flying Fox (Acerodon jubatus), The Philippines	Tom Hughes	21-Nov-13	This article details a study conducted to better understand the foraging behavior and travel patterns of the Golden Crown Flying Fox (Acerodon jubatus) in the Philippines. Understanding these patterns is vital to efforts of conservation of the endangered species, and predicting disease/virus emergence. The team captured multiple flying foxes in order to log body characteristics, test for disease and viruses, and imbed a gps tracking logger. The loggers revealed repetitive travel patterns to numerous foraging sites. The repetitious behavior causes an increased excretion of viral loads on feed and landscape that can lead to transmission to other wildlife leaving humans vulnerable to exposure. New foraging sites were discovered during the study that are close to popular roadways and human travel. Regional discoveries of zoonosis in related species in neighboring Indonesia reveal a risk of spreading Nipah and SARS.
11	"Middle East Respiratory Syndrome Coronavirus in Bats, Saudi Arabia"	Ziad memish, Kevin Olival, John Epstein	Nov-13	Bat CoVs are typically host specific, however, MERS-related CoVs have reportedly been found in many bat families. The authors created a phylogenetic tree showing genetic relatedness between coronaviruses identified in bat samples. The team tested bats in Saudi Arabia for the MERS CoV sequence and determined the prevalence of MERS in the area. The MERS CoV sequence was only detected in one bat but a broad distribution of MERS cases were found throughout the Middle East, thus denoting the possiblity of hosts other than bats. Future work should investigate additional bat and other wildlife species and domestic animals for CoV infection and potential linkage to human disease.
12	Risk Factors for Nipah Virus Infection among Pteropid Bats, Peninsular Malaysia	Tom Hughes	1-Jan	This article details a cross-sectional and longitudinal study to determine distribution of seropositivity to Nipah Virus among vampryrus and hypomelanus bats in peninsular Malaysia. The study found that the Pteropus species serves as the natural reservoir for NiV in Malaysia. The study showed that seroprevalence of NiV was higher in female bats that were pregnant, carrying a pup, and lactating. The study shows that vampryus bats are more commonly seropositive due to high mobility coupled with cross-border movement.
13	"A Longitudinal Study of the Prevalence of Nipah Virus in Pteropus lylei Bats in Thailand: Evidence for Seasonal Preference in Disease Transmission	Supaporn Wacharapluesadee	1-Mar	Over 90% of Nipah outbreaks have occurred during the first 5 months of the year and morbidity and mortality have increased in subsequent outbreaks. Although direct contact during breeding was believed to be an important transmission factor, this study seems to show that there may be other mechanisms responsible for transmission than direct contact during breeding in the same roost. Greater virus shedding over extended periods of time and the highest peak of virus detection in May when offspring start to separate may suggest that there may be mechanisms other than direct contact during breeding that cause spillover. Knowledge of seasonal preferences will help to better explain the dynamics of Nipah virus transmission and have implications for disease management
14	"*Pteropus vampyrus*, a hunted migratory species with a multinational home-range and a need for regional management"	John Epstein, Kevin Olival	25-Aug-09	This article looks at the challenges of managing migratory species that pose a threat to public health, specifically relating to the Malayan flying fox Pteropus vampyrus. Bats often move across borders within Southeast Asia and require regional management plans across their migratory range. This species of bat is also often hunted for food, sport, and medicine. Epstein et al. used roost site surveys, satellite telemetry, and data from hunter license sales and population protection models to assess the current sustainability of the flying fox population.
15	"Bats as bushmeat: a global review"	Simon Mickleburgh, Kerry Waylen, Paul Racey	1-Apr-09	This questionnaire and literature review gives an overview of bat hunting in the Old World tropics. Fruit bats of the genus Pteropus are the most widely eaten in Asia, likely because they roost in fruit trees and their whereabouts are predictable. Voluntary controls on hunting have assisted in preserving bat populations. The authors recommend continued surveys of the extent to which bats are used as bushmeat to inform conservation and health efforts. These surveys will help indicate why the meat is in demand, the effectiveness of regulation, and where to fill in gaps of education.
16	"Studies of Reservoir Hosts for Marburg Virus"	Robert Swanepoel	Dec-07	The authors examined a mine in northeastern Democratic Republic of the Congo to determine the hosts likely responsible for an outbreak of Marburg hemorrhagic fever. There was a clear link between breeding patterns of the bats and the occurrence of Marburg hemorrhagic fever. Outcome of virus infection, carrier status, and shedding of virus are influenced by bat age, reproductive status, diet, and type of bat. An evolutionary distinction may exist between cave-roosting bats as hosts of MARV and forest bats as host of Ebola virus. The authors recommend experimental infections in colonized bats to provide more clarity.

17	"Bat Nipah Virus, Thailand"	Supaporn Wacharapluesadee	Dec-05	Scientists surveyed Thailand s bat population to test for Nipah virus. Nipah virus RNA was found in bat saliva and urine, suggesting the persistence of Nipah virus infection in Thai bats. Many of the Thai bat species that carry the Nipa virus antibodies live near the borders of Malaysia and Cambodia. Countrywide surveillance is therefore needed to clarify the epidemiology of Nipah virus infections in relation to host, seasonal, and geographic attributes.
18	"Quantifying the Bat Bushmeat Trade in North Sulawesi, Indonesia, with Suggestions for Conservation Action"	Susan M. Tsang	1/26/2015	Tsang desired to assess local cultural attitudes towards bats for the formulation of a targeted conversation campaign. The article discusses the conducted survey and results, suggesting church engagement, student ambassador programs, meat substitution, and local conservation initiatives as potential next steps of conservation action.
19	"Understanding the Bushmeat Market: Why Do People Risk Infection from Bat Meat?"	Olivier Restif, James Wood, Alexandra Kamins	9-Oct-14	This article discusses the findings of Dr. Kamins and her colleages after they interviewed 577 people across southern Ghana, including hunters, vendors, and consumers of bat meat. Hunters use a variety of means to capture bats, but none reported using any sort of protective measures while hunting. Cooking bats is also done in a variety of ways, as the bushmeat serves as both subsistence and luxury food. The article concludes by calling for partnerships with local communities in Ghana to help find effective and sustainable solutions which align with economic needs.
20	Wildlife Trade and Human Health in Lao PDR: An Assessment of the Zoonotic Disease Risk in Markets.	Bounlom Douangngeun	23-Mar-16	This article is an assessment of the zoonotic disease risk of the bushmeat trade in Lao PDR. An observational survey was conducted from 2010-2013 in order to gather details about the volume of bushmeat markets, species sold, price, and market biosafety. Seven markets with the highest volumes were included in the study; 1,937 animals representing twelve different taxonomic families were observed for sale. The 12 taxonomic families represented have been documented to carry over 36 zoonotic pathogens. The 36 diseases documented include: rabies, SARS, Leptospirosis and Tuberculosis. Insectovous Bats were one of the taxa families observed, known to host 9 different zoonotic pathogens. The author noted a strong possibility of humans spreading the diseases due to high volume of regional and foreign visitors to the markets, and poor biosafety measures of the market (lack of hand washing and cleaning of tables, generally poor market cleanliness, selling wildlife alongside other fresh produce presents risks for food contamination and infection of humans with pathogens).
21	The Prevalence of Contagious Bovine Pleuropneumonia (CBPP) in Cameroon: A Case Study in Garoua Central Abattoir, Cameroon	Wade Abel	1-Jan-16	This article discusses the findings of a year long prevalence study of contagious bovine pleuropneumonia (CBPP) conducted among slaughtered cattle in Cameroon. The article includes a breakdown of the different species of cattle and the rate of prevalence of each species. The prevalence rate was astronomically greater in cattle between the ages of 5-10 as compared to cattle aged 0-5 and 10 years and above. CBPP is a chronic disease, meaning more cattle harbor the causative agent with time due to multiple exposure. The age at which the prevalence rate is greatest is also the age at which slaughter is greatest due to quantity of meat to be harvested. The results prove the endemic nature of CBPP, and the prevalence rates observed in Cameroon are significantly higher than Nigeria.
22	Eating and conserving bushmeat in Africa	John E. Fa, Robert Nasi	12/16/2015	This article plots a map of the most favorable regions for Ebola in Africa. The authors used known environmental and zoogeographic descriptors and biogeographic approaches; mainly, the authors used current models for Ebola distribution in Africa, and the mammalian distribution. The authors started out by mapping the environmentally favored regions for Ebola, then mapped the areas of expected exposure in mammals. The map shows that mammalian biogeography contributes to explaining distribution of Ebola; Ebola is more widespread than initially predicted. The goal of the article is to show the importance of biogeography in collaboration with virologacial, zoogeographical, and environmental information. Article states the importance of the role the bush meat market plays in the transmission of Ebola from wildlife to humans.
23	"Long-Term Urban Market Dynamics Reveal Increased Bushmeat Carcass Volume Despite Economic Growth and Prospective Environmental Legislation on Bioko Island, Equatorial Guinea"	Drew Cronin, Joshua Linder	31-Jul-15	This article analyzed the dynamics of the bushmeat market on Bioko Island, Equatorial Guinea in the context of economic growth, political events, and changes in legislation. Bushmeat hunting and availability increased as GDP and disposable income increased. They believe the emergence of a luxury market was driven by the immigration of people non-native to Bioko with a cultural preference for bushmeat. Hunting also increased following unenforced legislation.

	A	B	C	D
24	Ebola and bushmeat: myth and reality	John E. Fa	20-May-15	The author addresses some common misconceptions about bush meat and its connection to the spread of the Ebola Virus. First, the article addresses the threat Ebola poses on human populations. While the outbreak is severe, the death toll is estimated to cease at 10,000 as compared to 500,000 from malaria. Bush meat is key mechanism from which humans come in contact with pathogens, however, it is not a major risk for spreading Ebola to new areas such as the U.S. and Europe via the bush market due to long travel times and the common process of smoking the meat; the greater threat for transmission to new areas is person to person contact. Bats play a large role in transmitting pathogens; however, Ghana trades 100,000 bats per year for bush meat and yet has no cases of Ebola despite the presence of Ebola in the bats there.
25	"Synthesizing Bushmeat Research Effort in West and Central Africa: A New Regional Database"	G Taylor, J Scharlemann, Marcus Rowcliffe, Noelle Kumpel, Joshua Linder	Jan-15	The authors created a database for bushmeat off take, consumption, and trade in West and Central Africa. They collected data on 177 species from 275 sites across 11 countries over 30 years. The database helps identify patterns and drivers of bushmeat harvesting as well as informing future research priorities.
26	The harvest of wildlife for bushmeat and traditional medicine in East, South and Southeast Asia: Current knowledge base, challenges, opportunities and areas for future research	Tien Ming Lee, Robert Nasi, Miguel Pinedo-Vasquez	11-Nov-14	This paper provides an overview of the bushmeat market in Asia, with particular attention to the Southeast Asia region. The author outlines the bushmeat crisis currently facing the continen and defines the crisis as the overexploitation of wildlife and the recognition that the outcomes are undesirable both for conservation efforts as well as sociocultural needs. Large volumes of bushmeat transport, such as the illegal trade network that exist in most countries of Asia, leave the continent vulnerable to the spread of pathogens. As it pertains to Southeast Asia, the high concentration of illegal wildlife trade make the region a hotspot for future emerging infectious diseases. Solutions for limiting the illegal bushmeat trade include community education on risk factors that coincide with consumption, such as the SARS epidemic. The key to limiting the spread of infectious pathogens through bushmeat is to stop the illegal market and have all trade regulated by increasing border security.
27	"Beyond Bushmeat: Animal Contact, Injury, and Zoonotic Disease Risk in Western Uganda"	Sarah Paige	25-Mar-14	Paige examines activities other than hunting that bring people into contact with wildlife in sub-Saharan Africa, focusing on patterns of injuries from animals and contact with nonhuman primates. The study found that men are at higher risk for animal injury than women, and people living near forest habitats are at highest overall risk. Unlike similar studies, Paige found that touching a carcass was the primary form of primate contact in her population as opposed to butchering or eating bushmeat. This study shows that risky contact with wildlife occurs in landscapes other than forests with routine bushmeat hunting.
28	"Illegal Animal and (Bush)Meat Trade Associated Risk of Spread of Viral Infections"	Christopher Kilonzo	1-Jan-14	This article is a review of collaborative research done into the bushmeat industry around the globe. The issue lays with the developing high demand of bushmeat in developed countries. An increase in the demand leads to attempts to increase supply, furthering the amount of human contact with bush meat through hunting, butchering, and consumption. The expanded industry increases cross-species contact and transmission of diseases. The cross-species contact of Non Human Primates is believed to be the origin of Ebola. The problem is widespread in Southeast Asia specifically due to densely populated areas and access to biologically diverse ecosystems. Bush meat trade is also believed to be the origin of HIV/AIDS. The path forward includes culturally appropriate health education, conservation efforts, supply/demand focused intervention, and a surveillance tool.
29	"The bushmeat trade in African savannas: Impacts, drivers, and possible solutions"	Peter Lindsey, Guy Balme, Matthew Decker	Apr-13	This article looks at the spatial and temporal trends in occurrence of bushmeat hunting. Patterns include focusing efforts on protected areas with rarer animals, and areas where wildlife congregate such as near water, game trails, or fruit trees. Factors found to facilitate the bushmeat trade include political instability and demand for wildlife for traditional use. Potential solutions include incentivizing alternative livelihoods, providing alternative protein and carbohydrate supplies, and enforcing land-use regulations and protections. Combinations of various interventions are necessary and may vary among sites.
30	"Uncovering the fruit bat bushmeat commodity chain and the true extent of fruit bat hunting in Ghana, West Africa"	A. Kamins, Marcus Rowcliffe	Dec-11	The authors study the mechanisms by which bushmeats get to consumers, specifically following the African straw-colored fruit bat Eiodlon helvum. They estimate 128,000 bats are sold each year. Bats do not follow the normal commodity chain for bushmeat and are primarily sold through markets places (not restaurants) which makes bats often overlooked and underrepresented by many surveys.

	A	B	C	D
31	"The Scale of Illegal Meat Importation from Africa to Europe via Paris"	Anne-Lise Cambers, Marcus Rowcliffe	7-Jun-10	This article conducts a systematic survey of customs seizures of bushmeat, livestock meat, and fish carried by passengers arriving at Paris Roissy-Charles de Gaulle airport from sub-Saharan Africa. They estimate that 62 tons of meat and fish were imported from sub-Saharan Africa into a Paris airport over one week. The authors recommend better incentivizing customs officers to search for meat and increase penalties and fines for those found importing illegal meat.
32	"Incentives for Hunting: The Role of Bushmeat in the Household Economy in Rural Equatorial Guinea"	Noelle Kumpel, Marcus Rowcliffe,	Apr-10	It is important to understand the role of bushmeat within the wider rural economy in order to create effective policy regarding conservation and safety. They found that bushmeat is a necessity good with consumption and expenditure on bushmeat related less than proportionately to income. 60% of poor-to-middle income households hunted and traded bushmeat while richer households had other income-generating activities. Thus, hunting serves as an important source of fallback income for men without the alternative of preferable alternative opportunities.
33	"Bushmeat and International Development"	Glyn Davies	Jun-02	Conservation agencies and development agencies often have difficulty relating despite overlapping goals and interests. Davies recommends regulating bushmeat trade as a way of conserving natural resources and sustainably providing economic growth.
34	Agouti on the wedding menu: Bushmeat harvest, consumption and trade in a post-frontier region of the Ecuadorian Amazon	Miguel Pinedo-Vasquez, Robert Nasi	2015	This article serves as an analysis of the bushmeat market in Ecuador. The evidence gathered shows that the country of Ecuador has established laws both protecting the act of subsistence hunting in local rural markets, and has outlawed the sale of bushmeat for public consumption. The overexploitation of larger game has created foundation, and forests have begun to flourish with more desirable small game species. Nationally, the government of Ecuador recognizes the importance of hunting and bushmeat for economic and cultural purposes, and protects the act in its constitution. Strict enforcement creates an underground market. Ecuador also has a well regulated system of biodiversity, and interviews show that respondents to surveys recognize the importance of conservation. The bushmeat market in Ecuador has provided no evidence of foreign or national sales. The authors detail the importance of regulating bushmeat trade based on local necessities and not general national statistics.
35	"The harvest of wildlife for bushmeat and traditional medicine in East, South, and Southeast Asia"	Amanda Sigouin	2014	Asia has a booming but often illegal wildlife trade that drives the bushmeat crisis. The high concentration of illegal wildlife trade seizures in Southeast Asia make the region a hot spot for emerging infectious diseases. The lack of infrastructure, technical capacity, and political stability will make addressing the bushmeat crisis difficult. The book continues to view the bushmeat crisis through the lenses of food insecurity, traditional medicine, and urbanization. They conclude with recommendations and research opportunities to address each aspect of the issue.
36	Bushmeat harvest in tropical forests Knowledge base, gaps and research priorities	Varun Swamy, Miguel Pinedo-Vasquez	2014	This article presents the current statistics and research of the global bushmeat market. The goal of the article is to shift focus of future research to the topic of sustainability. The authors review past and present attempts to improve sustainability through management and intervention. Nearly 150,000 people living in forest ecosystems and 5 million people living in afrotropics consume upwards of 5 million tons of wild bush meat a year. Large animals that provide a lot of meat are the most targeted, often have lowest reproductive cycles, leading to unsustainable hunting levels. The bushmeat market has created a luxury demand, nearly 5 tons of unregulated bushmeat is smuggled through Paris airport every week. Strict control of licenses and arms has been successful in Malaysia, hunter education programs successful in Brazil, and community-based management successful in Peru.
37	"Bushmeat and Livelihoods: Wildlife Management and Poverty Reduction"	Glyn Davies, David Brown	2007	In this book, Davies analyzes the bushmeat market as both a threat to wildlife conservation and a significant component of livelihood for many people. Davies focuses on the human dimension of the debate because the values of wildlife often conflict with cultural and human societal values. The book explores both of these dimensions to best align and reconcile the varying priorities.
38	"Molecular and Mathematical Modeling Analyses of Inter-island Transmission of Rabies into a Previously Rabies-free Island in the Philippines"	Kentaro Tohma, Mariko Saito, Catalino Demetria	Mar-16	This article investigates the inter-island transmission of rabies in the Philippines using phylogenetic and modeling approaches. They found a lag time of several months to a year from rabies introduction to initial case detection, thus creating difficulties in identifying the initial introductory event. Molecular epidemiology can detect occasional introduction events from genetic information and can reveal how often spillover events happen, thus providing useful data for improving rabies control strategies.

39	Molecular Epidemiology of Rabies Viruses Circulating in Two Rabies Endemic Provinces of Laos, 2011–2012: Regional Diversity in Southeast Asia	Bounlom Douangngeun	31-Mar-15	A study conducted in order to gain knowledge about epidemiology and genetic characteristics of circulating rabies viruses in Laos. The data gathered showed gradual growth of positive rabies samples between 2004-2011. The study includes a Phylogenetic tree stating the bat origin rabies viruses form their own cluster. Further, there are three distinct viral lineages currently circulating the country. The genetic makeup of the strains show relation to those found in neighboring countries, indicating a shared ancestry. Due to size of the country, movement of people, and the number of dog , it is likely that multiple lineages and clusters of rabies will circulate Lao PDR.
40	Rabies Death Attributed to Exposure in Central America with Symptom Onset in a US Detention Facility - Texas, 2013	Neil Vora	9-May-14	This article details the case of a 28 year old Guatemalan Nationals diagnosed with rabies infection while in custody at a U.S. Immigration Detention Center in Texas. The case study illustrates the possibility of human to human transmission of rabies through exposure to mucus membranes, open wounds, saliva, tears, or nervous tissue.
41	"Genetic Diversity and Geographic Distribution of Genetically Distinct Rabies Viruses in the Philippines"	Mariko Saito, Hitoshi Oshitani, Catalino Demetria	4-Apr-13	This study performed a molecular analysis of rabies viruses using animal brain samples. They found multiple strains diverged and divided from different island groups in the Philippines. The results suggest the viruses evolved independently in each geographic area without frequent introduction into other areas. Application includes the idea of geographically targeted vaccination in the different island groups.
42	"A Seroepidemiologic Study of Reston Ebolvairus in Swine in the Philippines"	Yusuke Sayama, Catalino Demetria	23-Feb-12	This article aimed to clarify how REBOV infection was spread among swine during epizootics. The study used multiple serological assays to test the swine and confirm they are susceptible for REBOV infection. The serological assays should also be useful for future surveillance or a serological survey of REBOV infection in swine.
43	"Trapid Detection of Rabies Virus by Reverse Transcription Loop-Mediated Isothermal Amplification"	Bazartseren Boldbaatar, Catalino Demetria	30-Mar-09	A sensitive, specific, and reliable diagnosis is important in diagnosing rabies. A direct fluorescent antibody (DFA) test is the most frequently used test in animals while reverse-transcription polymerase chain reaction (RT-PCR) is most common in humans. Both of these tests require expensive equipment and can be difficult to adopt in developing countries. This study developed reverse-transcription loop-mediated isothermal amplification (RT-LAMP) as a less resource-intensive rapid and reliable test for rabies in both humans and animals.
44	"Wildlife Trade and Global Disease Emergence"	William Karesh	Jul-05	Global trade in wildlife can result in disease transition that threatens human disease outbreaks, livestock, native wildlife populations, and the health of ecosystems. Instead of eradiating these dangerous pathogens or the species that carry them, Karesh et al. suggest decreasing the contact rate among species, specifically in wildlife trade. Wildlife markets are generally networks with major hubs that provide practical control opportunities. Karesh also argues that focusing on markets is a cost-effective way to decrease the spread of diseases.
45	"The Impact of a Monthly Rest Day on Avian Influenza Virus Isolation Rates in Retail Live Poultry Markets in Hong Kong"	K. Y. Kung, Y. Guan	14-Apr-02	Live poultry markets act as a reservoir for many diseases that are passed between animals and humans. This study found that the isolation rate of avian influenza (AI) was significantly lower after a day of rest in the markets where stalls were completely emptied, cleaned, and restocked. This was not true for all diseases, as Newcastle disease virus was not affected by this intervention.
46	"Integrated Assessment Models for Ecologists: the Present and the Future"	Michael Harfoot, Jorn Scharlemann	11-Aug-13	Integrated assessment models (IAMs) are useful for analyzing socio-environmental factors in ecological and biodiversity modeling. The authors review four IAMs and identify challenges for implementation among ecologists. The IAM community and ecological community would both benefit from greater collaboration to align incentives.

Subject: Global Bat Alliance Meeting 29 JUNE Document for Review
Attachment(s): "TORFTA_GBA_v10.docx","GBA Meeting Overview_29June2017_v2.docx"

All,

Ahead of the Inaugural GBA Steering Committee Meeting next Thursday, we wanted to pass along the attached revised version of the Terms of Reference for Trusted Agents for your review. We will work to finalize this document during our meeting. The agenda for the meeting (this has not changed) is also attached for your reference.

Please let us know if you have any questions. Looking forward to seeing you all at our meeting next week!

v/r,
Caitlin Devaney

Global Bat Alliance Meeting

Overview (objectives and agenda)
29 June 2017

Meeting objectives (proposed)

1. Finalize GBA Terms of Reference for Trusted Agents (TORFTA)
2. Identify bat research focus areas and associated mentorship leads for each area
3. Prioritize research needs and gaps for each focus area and identify correlating researchers, institutions, other networks / alliances, and funding entities
4. Draft short and long-term timelines and workplans for each focus area
5. Determine steering committee convening schedule and Cohort II / III / IV training schedule

Focus areas (proposed)

- Virus / host relationship
- Commodity chain and trade routes
- Ecological change and effects
- Bat, livestock, and wildlife interactions

Note: these focus areas are not regionally based as previously discussed, in an effort to build towards the overarching objective of a multi-regional, multi-disciplinary network; they will be the subject of discussion during the 29 June GBA Meeting in Fort Collins

Agenda

Time	Agenda Topic and Facilitator or Speaker	Expected Outcomes
0930 – 1000	**Welcome and Introductions**	
1000 – 1015	**Global Bat Alliance Overview** *Dr. Mary Lancaster (Africa Science Lead)* *Dr. Marty Stokes (SEA Science Lead, CBEP)*	• Review discussions leading up to this meeting • Discuss how this meeting is an opportunity to formalize the central / steering committee node for the distributed network • Emphasize that the steering committee shall focus on mentorship and connecting individuals and institutions across the globe
1015 – 1045	**Review Charter and Move to Agreement** *TBD*	• Vote to accept organizational document for steering committee

		• Unanimous (??) acceptance • We will advertise intent ahead of meeting • We will convene a meeting on 7 June to review and discuss the draft TORFTA
1045 – 1115	**Identify and discuss research focus areas** *TBD*	• Group will identify and discuss overarching focus areas and sub focus areas • Steering committee and invitees shall self nominate to groups and agree to serve as research mentors for the groups
1115 – 1230	**Breakout: Prioritize research needs and gaps** *TBD*	• Group will breakout into their research focus areas and begin identifying needs and gaps • Groups will then work to prioritize their lists
1230 – 1330	**Working Lunch** *TBD*	• Buffet • Convene back as a group, hold discussions about the overarching objectives of the alliance • Discuss One Health and Vector-based International meetings as an opportunity to re-convene semi-annually
1330 – 1400	**Breakout: Draft timelines and workplans** *TBD*	• Begin drafting short and long-term timelines and workplans for each focus area • Short-term milestones could include identifying key researchers and networks • Long-term milestones could include training events and focus area meetings
1400 – 1430	**Closing / review of actions** *TBD*	• Close-out meeting / 5min brief out for each group (2 slides) • Review action items and next steps

PROPOSED TERMS OF REFERENCE FOR TRUSTED AGENTS OF THE GLOBAL BAT ALLIANCE

1. BACKGROUND

The Global Bat Alliance (GBA) will serve as a platform to identify and connect interdisciplinary expertise to address challenges and threats posed by bat-associated pathogens of security concern. Specifically, the GBA shall convene a body of experts and researchers to: (1) share information, data, samples, and protocols; (2) coordinate research activities; (3) build training events and awareness-building workshops at all levels of decision-making authority; (4) develop community standards and best research practices; (5) create mentorship-based opportunities for students, trainees, and early-career researchers to convene, present, and share ideas; and (6) establish a community of international research leaders and champions.

Some of the world's most deadly emerging zoonotic diseases are found in bats, including Nipah, Hendra, and Marburg viruses. There are a number of factors which make bats unique disease reservoirs, including their social behavior and mutual grooming patterns, ability to travel long distances, nocturnal activity, species diversity, and long life span (10-20 years, compared with a rat's average life of two years).[1] These characteristics make bats very difficult to study within traditional controlled laboratory settings and create research challenges to understanding their roles in the global zoonotic disease ecology. The GBA will create opportunities for policy makers, researchers, funders, and students to identify research challenges, develop priority lists and associated action plans to target needs and gaps, and work at all levels to build awareness of bat-associated disease burden and transmission risks to improve the prevention, detection, diagnosis, and reporting of pathogens of security concern.[2]

2. GBA MISSION AND VISION

The GBA shall bring together scientists, policy makers, and medical/veterinary practitioners with interests in bat-related research involving pathogens of security concern. The network will build on community standards and best practices for research. The GBA will identify and share information on research funding opportunities offered by multiple institutions. Most importantly, the alliance will foster international relationships among collaborators, agencies, and organizations, which can produce long-term, sustainable partnerships that withstand changes in government and organization budgets, priorities, postures, and policies.

The Trusted Agents of the alliance with play a role in operationalizing the GBA, strengthening the linkages and reducing overlap in the global research effort on high-priority diseases of bats (especially

[2] Schountz, Tony, "Immunology of Bats and Their Viruses; Challenges and Opportunities," *Viruses,* 2014 Dec; 6(12): 4880-4901. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4276934/

zoonoses) to maximize the efficient use of expertise and resources and accelerate the coordinated development of disease surveillance and control methods.

3. OBJECTIVES

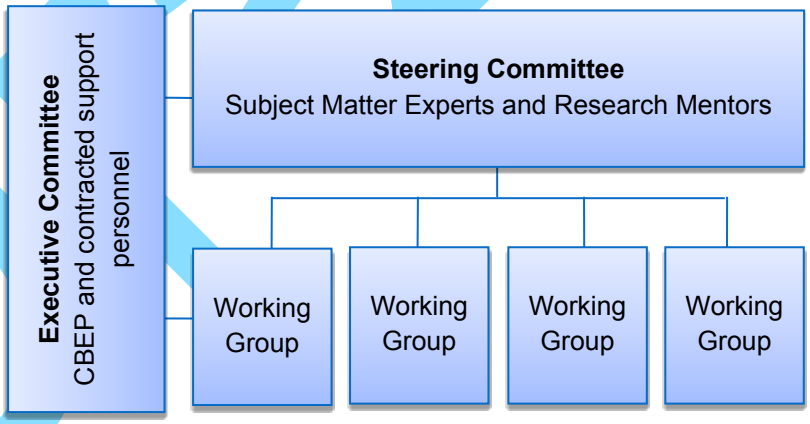
The objectives of the GBA are as follows:

- Facilitate interdisciplinary collaboration to identify research goals and needs for bat-associated disease research and disease threat reduction; and
- Unify CBEP regions to create a common action plan that yields collaborative projects that achieve the following end states: (1) better informed policy-makers; (2) better informed scientific community regarding funding targets and gaps in areas of research and development; and (3) better defined threat to global health security from bat-associated pathogens

4. APPROACH

The Terms of Reference for Trusted Agents (TORFTA) will convene subject matter experts to serve as mentors and function as independent, trusted advisors and honest brokers for research within the GBA. Trusted Agents will function within an organizational structure that consists of an Executive Committee, a Steering Committee, and four subject matter focused Working Groups.

4.1 The **Executive Committee (EC)** will be chaired by the CBEP Science Leads from Africa and Southeast Asia with organizational and administrative support from designated contractors for the program. The EC shall be responsible for developing GBA governance policies and guidelines, which includes funding decisions and approval of nominations for individuals to serve on the Steering Committee (SC) and within the Working Groups. As such, the EC shall be the sole decision-making body regarding funding while the SC shall be a separate body that makes recommendations on research priorities and targets to the EC. Since the EC will be comprised of members from the CBEP Research Program, the details regarding program requirements and processes for funding can be found in Appendix A of this document and should be used as a resource for all GBA members who wish to submit projects to CBEP.



The EC and their team shall additionally be responsible for the following tasks (at a minimum):

- Establish broad objectives and goals for the GBA
- Organize and facilitate meetings for the GBA
- Provide secretarial support for all virtual and in-person meetings for the GBA
- Prepare materials on request

- Disseminate information including (but not limited to) newsletters, website links, press releases, meetings and conferences
- Coordinate with other funding agencies and organizations

4.2 The **Steering Committee (SC)** shall include scientific experts that shall act as the scientific coordinating body for global bat research, provide research gap analysis, and priority setting to the EC, as well as considering the scientific merit of proposals from the EC and assist with their implementation as per the terms of reference. As such, the selection process for SC membership seeks to cultivate a balanced body of globally representative individuals, both geographically and across the bat research spectrum. The SC shall be responsible for the following items (at a minimum):

- Act as a scientific coordinating body for the GBA
- Consider the scientific merit of proposals from the EC
- Serve as subject matter experts and research mentors for implementation of accepted GBA-endorsed projects
- Propose research priorities
- Review and make recommendations on any matter involving an alteration in the mandate, terms of reference, membership, or structure of the GBA
- Review, discuss, and make recommendations for the logistics requirements of the GBA, sources and means of political and financial support, and its capability to function correctly in the future
- Define missions and submissions of the Working Groups (WGs), as well as identifying need for proposing establishment of new or closing-out existing WGs
- Supporting WGs in organizing gap analyses and research prioritization
- Promote interactions between WGs
- Assess and report progress of the WGs to other members of the SC and EC
- Develop and encourage exchange of protocols and best practices, and agree on standard operating procedures, good research practice, and roadmap to reach GBA goals (short and long-term)

4.2.1 Participate in semi-annual meetings. Meetings will normally take place twice annually in a place and at a time that is convenient for participants to a bat-relevant conference or meeting. The Chair (*please note: a more in-depth discussion concerning the SC "Chairman" will take place at the 29 June meeting; this document will be updated live in accordance with the outcomes of those discussions*) may convene meetings at other times when they find support of at least two thirds of the members of the Steering Committee. These meetings can be virtual or in-person. The Secretary is responsible for ensuring that the agenda of the meeting is made available to the members no later than one week before the meeting.

4.2.2 Develop recommendations. Business will be conducted by careful and considered deliberation leading to recommendations to the GBA. Recommendations shall be decided by consensus where possible. Consensus means that after deliberation all members support a particular point of view. Where consensus is not achieved, recommendations

shall be decided by simple majority vote of members voting on the question. In the case of a tied vote, the person acting as Chair shall be entitled to a second or deciding vote.

4.2.3 Attain consensus. A quorum is constituted by half of the number of individuals composing the Steering Committee rounded up when the number in the Steering Committee is uneven. The Steering Committee may decide by consensus or majority vote to ask parties who are not members of the Steering Committee to participate in a meeting so that they can provide relevant information, material, or knowledge. The Steering Committee may establish sub-committees consisting of 3 or more of its members and refer to them any matter in the Steering Committee's mandate. It may co-opt other GBA participants onto such committees.

4.3 The **Working Groups (WGs)** shall serve to divide the GBA into multi-disciplinary, multi-national focus areas to meet the research challenges associated with bat-borne diseases. Members of the SC shall serve as research mentors and subject matter experts within each WG. There will be no term limits, as WG members are encouraged to contribute and participate indefinitely. GBA members shall be nominated to participate in a WG by members of the EC or SC. The WGs will focus on the following focus areas (*please note, these focus areas are very much in draft form and will be the subject of discussion during the 29 June GBA Meeting in Fort Collins)*:

- Virus / host relationship
- Commodity chain and trade routes
- Ecological change and effects
- Bat, livestock, and wildlife interactions

5. GOVERNANCE AND MEMBERSHIP

5.1 Accountability

The overarching duty of the GBA is to develop multi-disciplinary and multi-national, hypothesis driven, research projects that meet the prioritized challenges defined by the Executive Committee under advice from the Steering Committee. Accountabilities of the GBA EC, SC, and Members include the following:

- Each member shall be familiar with the TORFTA and the mandate of the committees or WGs on which they serve
- Each member shall promote a culture of responsible practice for scientific research
- Each member shall work towards the short and long-term goals for the benefit of the GBA with a particular emphasis on the foci that fall within their WG
- Members of the SC are selected for their breadth of experience, insight and knowledge, integrity and character, and sound and independent judgment; therefore, they are expected to bring these personal qualities to their role on the SC and apply impartial judgment to help the EC make informed and independent decisions

5.2 Conflicts of Interest

This terms of reference document chooses the National Academy of Sciences (NAS) definition of Conflict of Interest: "a conflict of interest in research exists when the individual has interests in the

outcome of the research that may lead to a personal advantage and that might therefore, in actuality or appearance compromise the integrity of the research."

No member of the Steering Committee may participate in a discussion where such participation would give rise to a potential conflict of interest. As defined in section 4.1, the EC shall review all situations and decisions insofar as a financial obligation is at stake. SC members may leave their term of service on the SC if they wish to participate in a funding opportunity that would otherwise be perceived as a conflict of interest. SC members may recuse themselves if any personal advantage, not just those of financial benefit, is perceived. Any member of the SC may discuss possible conflicts of interest with the EC before stepping down from their term of service.

5.3 Selecting Committee Members

The SC and members of the WGs shall include members that reflect the multi-disciplinary and multi-national nature of the GBA. There are no term limits for members of the GBA, who are allowed to participate at will in accordance with terms of the TORFTA. However, members of the SC follow other rules for selection:

- ***5.3.1*** ***Terms of service –*** *2 years, no term limit*
- ***5.3.2*** ***Eligibility*** *– representation from each CBEP region must be maintained*
- ***5.3.3*** ***Nomination process –*** *nominated at the end of even calendar years by peers (members of the GBA) at GBA research review meetings or electronically*
- ***5.3.4*** ***Selection process –*** *reviewed by members of the EC under advisement of the SC*

(*please note: a more in-depth discussion concerning the scope of the total number of SC members will take place at the 29 June meeting; this document will be updated live in accordance with the outcomes of those discussions*)

APPENDIX A: APPLYING FOR FUNDING VIA EXECUTIVE COMMITTEE / CBEP

A.1 CBEP Research Scope

In order for CBEP to remain relevant, agile, and sustainable, research projects must be aimed at threat reduction objectives and demonstrate a clear nexus with the biosurveillance mission. The scope of CBEP research priorities include (but are not limited to):

- Understanding the ecology and epidemiology of pathogens of security concern, including HHS and USDA Biological Select Agents and Toxins and pathogens of pandemic potential, emerging, and re-emerging infectious diseases (e.g., avian influenza [low and highly pathogenic], African swine fever, Middle East Respiratory Syndrome (MERS), Ebola)
- Differentiating infectious diseases presenting clinical signs and symptoms similar to those of pathogens of security concern (e.g., influenza-like illness, acute febrile illness, fever of unknown origin)

CBEP will not support research projects that have no clear link to its threat reduction mission, are not sustainable for the partner country, or propose activities constituting Dual Use Research of Concern. These and other requirements and constraints are outlined in the figure below.

CBEP Fundamental Research Scope

In Scope	Out of Scope

Projects that demonstrate:
• Clear relationships to pathogens of security concern
  ○ U.S. Biological Select Agents *
  ○ Pathogens of pandemic potential
  ○ Emerging or re-emerging infectious diseases
  ○ Differentiating pathogens of security concern from agents with similar clinical signs and symptoms
• Links to threat reduction mission
• Support of BS&S and biosurveillance capabilities that reduce the threat of pathogens of security concern
  ○ Rapid, accurate, and safe detection, diagnoses, and reporting
• Alignment with both CBEP and partner country infectious disease priorities
• Use of sustainable techniques, procedures, and approaches in appropriate facilities
	Projects that focus on:
	• Dual-Use Research of Concern (DURC)
	• Diagnostic assay / novel technology
	• Development **
	• Medical countermeasures
	• Non-infectious diseases
	
	Projects that contain:
	• Establishment of new pathogen repositories
	• No link to pathogens of security concern
	• No clear alignment to threat reduction mission
	• Use of unsustainable techniques, procedures, or inappropriate facilities
	  ○ Requires use of supplies or resources not available in country
	• No clear research question or hypothesis

	• No potential to generate knowledge that may result in scientific publications

* Pathogens on the HHS and USDA Biological Select Agent and Toxins List

** Field or country-specific validation of new diagnostic assays, novel technologies or equipment may be in scope if meeting other in-scope criteria

A.2 Applying for DTRA CBEP Research Funding

CBEP Research Objectives and Scope

DTRA CBEP is continuously seeking new collaborators, partners and international partners to conduct cooperative biological research to inform and enhance disease surveillance and global health security. Projects that are hypothesis-driven and contain substantive engagement with and contribution by partner country institutions and scientists are appropriate for CBEP research funding. Research projects that support CBEP objectives in partner countries include those that promote One Health, improve disease surveillance, enhance understanding of endemic pathogens, explore the microbial ecology of endemic organisms, and enhance host country capabilities in support of World Health Organization International Health Regulations and World Organization for Animal Health reporting standards. Pathogens of interest include Biological Select Agents and Toxins, pathogens of pandemic potential, emerging and re-emerging infectious diseases, and pathogens that are co-syndromic with associated select agent etiologies such as Influenza-Like Illness or Acute Febrile Illness. CBEP does not support research topics that involve Dual- Use Research of Concern or focus on disease agents that are sexually transmitted, non-infectious, or do not pose a threat to global health security.

Research projects supported by CBEP must align with CBEP's overarching goals to reduce the threat to U.S. and global health security and are expected to produce results suitable for scientific publication.

Applying to the Broad Agency Announcement (BAA) and Government Call

CBEP welcomes research funding applications from domestic and foreign academic, private, and government institutions, and has multiple solicitations available for proposals.

- Academic institutions, non-governmental organizations, industry, foreign laboratory equivalents, and members of the private sector must apply through Thrust Area 6: Cooperative Counter Weapons of Mass Destruction (CWMD) Research with Global Partners of the Fundamental Research to Counter Weapons of Mass Destruction (FRCWMD) – BAA (HDTRA1-14-24- FRCWMD-BAA).
- U.S. Government partners and Federally Funded Research and Development Centers (FFRDCs) must apply through Thrust Area 6 of the FRCWMD Government Call (HDTRA1-12-17- FRCWMD-Call).

All research ideas MUST be pre-coordinated through submission of an abstract to FRCWMD-TA6@dtra.mil prior to submitting a white paper. White papers (aka Phase I proposal) must be submitted and a full proposal (aka Phase 2 Proposal) invited prior to submission of a full proposal. Phase 1 and Phase 2 proposals to the FRCWMD-BAA must be submitted through www.grants.gov. Phase 1 and Phase 2 proposals to the FRCWMD-Call must be submitted through www.dtrasubmission.net. White papers and proposals will be peer reviewed in accordance with the evaluation criteria published in the

BAA and Call and in coordination with appropriate CBEP Regional and Country Managers. To be successful, a white paper and/or proposal must align with both the DTRA/SCC-WMD CBEP mission and regional priorities.

Detailed instructions for the FRCWMD-BAA and the FRCWMD-Call can be found through the solicitation links at www.dtrasubmission.net. Please ensure that you are downloading and reviewing the latest amended full announcement for the most accurate information and instructions. Offerors may submit questions of an administrative nature to HDTRA1-FRCWMD-A@dtra.mil, and of a technical nature to FRCWMD-TA6@dtra.mil.

Subject: Global Bat Alliance Steering Committee meeting - info
Attachment(s): "TORFTA_GBA_v10.docx","GBA Meeting Overview_29June2017_v2.docx"

On behalf of Mary Lancaster and Marty Stokes, we're excited to convene the first in-person meeting of the Steering Committee for the Global Bat Alliance.

As friendly reminders of what to expect:

- Convene on Thursday, June 29th, in room 142 of the University Center for the Arts (same building as the conference)
- Start at 9:30AM local time (room will be open by 9AM)
- Working lunch (lunch provided) - vegetarian option included
- Plan to end the meeting at 2:30PM local time
- For those of you calling in, we will get that information to you within the next day.

I have attached again our agenda as well as the Terms of Reference for Trusted Agents for your reference and review.

If you have any questions, do not hesitate to reach out to any of us in the CC line. The number below is my cell phone.

Best,

Will Sander, DVM, MPH, DACVPM, PMP

Booz Allen Hamilton
CTR A&AS Support Contractor

Global Bat Alliance Meeting

Overview (objectives and agenda)
29 June 2017

Meeting objectives (proposed)

1. Finalize GBA Terms of Reference for Trusted Agents (TORFTA)
2. Identify bat research focus areas and associated mentorship leads for each area
3. Prioritize research needs and gaps for each focus area and identify correlating researchers, institutions, other networks / alliances, and funding entities
4. Draft short and long-term timelines and workplans for each focus area
5. Determine steering committee convening schedule and Cohort II / III / IV training schedule

Focus areas (proposed)

- Virus / host relationship
- Commodity chain and trade routes
- Ecological change and effects
- Bat, livestock, and wildlife interactions

Note: these focus areas are not regionally based as previously discussed, in an effort to build towards the overarching objective of a multi-regional, multi-disciplinary network; they will be the subject of discussion during the 29 June GBA Meeting in Fort Collins

Agenda

Time	Agenda Topic and Facilitator or Speaker	Expected Outcomes
0930 – 1000	**Welcome and Introductions**	
1000 – 1015	**Global Bat Alliance Overview** *Dr. Mary Lancaster (Africa Science Lead)* *Dr. Marty Stokes (SEA Science Lead, CBEP)*	• Review discussions leading up to this meeting • Discuss how this meeting is an opportunity to formalize the central / steering committee node for the distributed network • Emphasize that the steering committee shall focus on mentorship and connecting individuals and institutions across the globe
1015 – 1045	**Review Charter and Move to Agreement** *TBD*	• Vote to accept organizational document for steering committee

		• Unanimous (??) acceptance • We will advertise intent ahead of meeting • We will convene a meeting on 7 June to review and discuss the draft TORFTA
1045 – 1115	**Identify and discuss research focus areas** *TBD*	• Group will identify and discuss overarching focus areas and sub focus areas • Steering committee and invitees shall self nominate to groups and agree to serve as research mentors for the groups

[2] Schountz, Tony, "Immunology of Bats and Their Viruses; Challenges and Opportunities," *Viruses,* 2014 Dec; 6(12): 4880-4901. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4276934/

zoonoses) to maximize the efficient use of expertise and resources and accelerate the coordinated development of disease surveillance and control methods.

3. OBJECTIVES

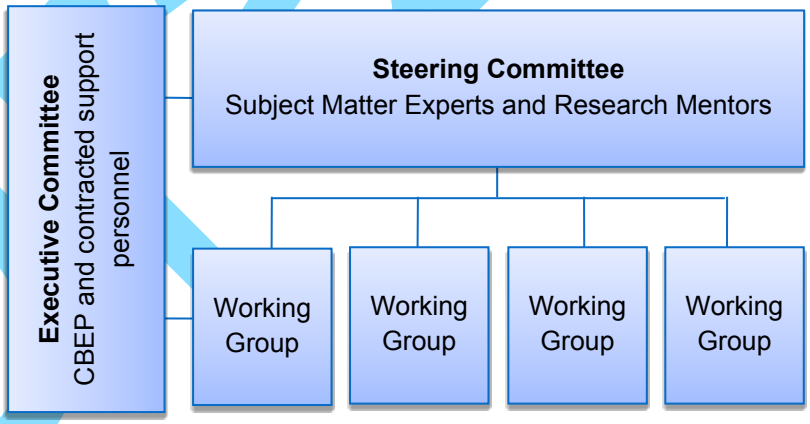
The objectives of the GBA are as follows:

- Facilitate interdisciplinary collaboration to identify research goals and needs for bat-associated disease research and disease threat reduction; and
- Unify CBEP regions to create a common action plan that yields collaborative projects that achieve the following end states: (1) better informed policy-makers; (2) better informed scientific community regarding funding targets and gaps in areas of research and development; and (3) better defined threat to global health security from bat-associated pathogens

4. APPROACH

The Terms of Reference for Trusted Agents (TORFTA) will convene subject matter experts to serve as mentors and function as independent, trusted advisors and honest brokers for research within the GBA. Trusted Agents will function within an organizational structure that consists of an Executive Committee, a Steering Committee, and four subject matter focused Working Groups.

4.1 The **Executive Committee (EC)** will be chaired by the CBEP Science Leads from Africa and Southeast Asia with organizational and administrative support from designated contractors for the program. The EC shall be responsible for developing GBA governance policies and guidelines, which includes funding decisions and approval of nominations for individuals to serve on the Steering Committee (SC) and within the Working Groups. As such, the EC shall be the sole decision-making body regarding funding while the SC shall be a separate body that makes recommendations on research priorities and targets to the EC. Since the EC will be comprised of members from the CBEP Research Program, the details regarding program requirements and processes for funding can be found in Appendix A of this document and should be used as a resource for all GBA members who wish to submit projects to CBEP.



The EC and their team shall additionally be responsible for the following tasks (at a minimum):

- Establish broad objectives and goals for the GBA
- Organize and facilitate meetings for the GBA
- Provide secretarial support for all virtual and in-person meetings for the GBA
- Prepare materials on request

- Disseminate information including (but not limited to) newsletters, website links, press releases, meetings and conferences
- Coordinate with other funding agencies and organizations

4.2 The **Steering Committee (SC)** shall include scientific experts that shall act as the scientific coordinating body for global bat research, provide research gap analysis, and priority setting to the EC, as well as considering the scientific merit of proposals from the EC and assist with their implementation as per the terms of reference. As such, the selection process for SC membership seeks to cultivate a balanced body of globally representative individuals, both geographically and across the bat research spectrum. The SC shall be responsible for the following items (at a minimum):

- Act as a scientific coordinating body for the GBA
- Consider the scientific merit of proposals from the EC
- Serve as subject matter experts and research mentors for implementation of accepted GBA-endorsed projects
- Propose research priorities
- Review and make recommendations on any matter involving an alteration in the mandate, terms of reference, membership, or structure of the GBA
- Review, discuss, and make recommendations for the logistics requirements of the GBA, sources and means of political and financial support, and its capability to function correctly in the future
- Define missions and submissions of the Working Groups (WGs), as well as identifying need for proposing establishment of new or closing-out existing WGs
- Supporting WGs in organizing gap analyses and research prioritization
- Promote interactions between WGs
- Assess and report progress of the WGs to other members of the SC and EC
- Develop and encourage exchange of protocols and best practices, and agree on standard operating procedures, good research practice, and roadmap to reach GBA goals (short and long-term)

4.2.1 Participate in semi-annual meetings. Meetings will normally take place twice annually in a place and at a time that is convenient for participants to a bat-relevant conference or meeting. The Chair (*please note: a more in-depth discussion concerning the SC "Chairman" will take place at the 29 June meeting; this document will be updated live in accordance with the outcomes of those discussions*) may convene meetings at other times when they find support of at least two thirds of the members of the Steering Committee. These meetings can be virtual or in-person. The Secretary is responsible for ensuring that the agenda of the meeting is made available to the members no later than one week before the meeting.

4.2.2 Develop recommendations. Business will be conducted by careful and considered deliberation leading to recommendations to the GBA. Recommendations shall be decided by consensus where possible. Consensus means that after deliberation all members support a particular point of view. Where consensus is not achieved, recommendations

shall be decided by simple majority vote of members voting on the question. In the case of a tied vote, the person acting as Chair shall be entitled to a second or deciding vote.

4.2.3 Attain consensus. A quorum is constituted by half of the number of individuals composing the Steering Committee rounded up when the number in the Steering Committee is uneven. The Steering Committee may decide by consensus or majority vote to ask parties who are not members of the Steering Committee to participate in a meeting so that they can provide relevant information, material, or knowledge. The Steering Committee may establish sub-committees consisting of 3 or more of its members and refer to them any matter in the Steering Committee's mandate. It may co-opt other GBA participants onto such committees.

4.3 The **Working Groups (WGs)** shall serve to divide the GBA into multi-disciplinary, multi-national focus areas to meet the research challenges associated with bat-borne diseases. Members of the SC shall serve as research mentors and subject matter experts within each WG. There will be no term limits, as WG members are encouraged to contribute and participate indefinitely. GBA members shall be nominated to participate in a WG by members of the EC or SC. The WGs will focus on the following focus areas (*please note, these focus areas are very much in draft form and will be the subject of discussion during the 29 June GBA Meeting in Fort Collins)*:

- Virus / host relationship
- Commodity chain and trade routes
- Ecological change and effects
- Bat, livestock, and wildlife interactions

5. GOVERNANCE AND MEMBERSHIP

5.1 Accountability

The overarching duty of the GBA is to develop multi-disciplinary and multi-national, hypothesis driven, research projects that meet the prioritized challenges defined by the Executive Committee under advice from the Steering Committee. Accountabilities of the GBA EC, SC, and Members include the following:

- Each member shall be familiar with the TORFTA and the mandate of the committees or WGs on which they serve
- Each member shall promote a culture of responsible practice for scientific research
- Each member shall work towards the short and long-term goals for the benefit of the GBA with a particular emphasis on the foci that fall within their WG
- Members of the SC are selected for their breadth of experience, insight and knowledge, integrity and character, and sound and independent judgment; therefore, they are expected to bring these personal qualities to their role on the SC and apply impartial judgment to help the EC make informed and independent decisions

5.2 Conflicts of Interest

This terms of reference document chooses the National Academy of Sciences (NAS) definition of Conflict of Interest: "a conflict of interest in research exists when the individual has interests in the

outcome of the research that may lead to a personal advantage and that might therefore, in actuality or appearance compromise the integrity of the research."

No member of the Steering Committee may participate in a discussion where such participation would give rise to a potential conflict of interest. As defined in section 4.1, the EC shall review all situations and decisions insofar as a financial obligation is at stake. SC members may leave their term of service on the SC if they wish to participate in a funding opportunity that would otherwise be perceived as a conflict of interest. SC members may recuse themselves if any personal advantage, not just those of financial benefit, is perceived. Any member of the SC may discuss possible conflicts of interest with the EC before stepping down from their term of service.

5.3 Selecting Committee Members

The SC and members of the WGs shall include members that reflect the multi-disciplinary and multi-national nature of the GBA. There are no term limits for members of the GBA, who are allowed to participate at will in accordance with terms of the TORFTA. However, members of the SC follow other rules for selection:

- ***5.3.1*** ***Terms of service –*** *2 years, no term limit*
- ***5.3.2*** ***Eligibility*** *– representation from each CBEP region must be maintained*
- ***5.3.3*** ***Nomination process –*** *nominated at the end of even calendar years by peers (members of the GBA) at GBA research review meetings or electronically*
- ***5.3.4*** ***Selection process –*** *reviewed by members of the EC under advisement of the SC*

(*please note: a more in-depth discussion concerning the scope of the total number of SC members will take place at the 29 June meeting; this document will be updated live in accordance with the outcomes of those discussions*)

APPENDIX A: APPLYING FOR FUNDING VIA EXECUTIVE COMMITTEE / CBEP

A.1 CBEP Research Scope

In order for CBEP to remain relevant, agile, and sustainable, research projects must be aimed at threat reduction objectives and demonstrate a clear nexus with the biosurveillance mission. The scope of CBEP research priorities include (but are not limited to):

- Understanding the ecology and epidemiology of pathogens of security concern, including HHS and USDA Biological Select Agents and Toxins and pathogens of pandemic potential, emerging, and re-emerging infectious diseases (e.g., avian influenza [low and highly pathogenic], African swine fever, Middle East Respiratory Syndrome (MERS), Ebola)
- Differentiating infectious diseases presenting clinical signs and symptoms similar to those of pathogens of security concern (e.g., influenza-like illness, acute febrile illness, fever of unknown origin)

CBEP will not support research projects that have no clear link to its threat reduction mission, are not sustainable for the partner country, or propose activities constituting Dual Use Research of Concern. These and other requirements and constraints are outlined in the figure below.

CBEP Fundamental Research Scope

In Scope	Out of Scope

Projects that demonstrate:
• Clear relationships to pathogens of security concern
  ○ U.S. Biological Select Agents *
  ○ Pathogens of pandemic potential
  ○ Emerging or re-emerging infectious diseases
  ○ Differentiating pathogens of security concern from agents with similar clinical signs and symptoms
• Links to threat reduction mission
• Support of BS&S and biosurveillance capabilities that reduce the threat of pathogens of security concern
  ○ Rapid, accurate, and safe detection, diagnoses, and reporting
• Alignment with both CBEP and partner country infectious disease priorities
• Use of sustainable techniques, procedures, and approaches in appropriate facilities
	Projects that focus on:
	• Dual-Use Research of Concern (DURC)
	• Diagnostic assay / novel technology
	• Development **
	• Medical countermeasures
	• Non-infectious diseases
	
	Projects that contain:
	• Establishment of new pathogen repositories
	• No link to pathogens of security concern
	• No clear alignment to threat reduction mission
	• Use of unsustainable techniques, procedures, or inappropriate facilities
	  ○ Requires use of supplies or resources not available in country
	• No clear research question or hypothesis

	• No potential to generate knowledge that may result in scientific publications

* Pathogens on the HHS and USDA Biological Select Agent and Toxins List

** Field or country-specific validation of new diagnostic assays, novel technologies or equipment may be in scope if meeting other in-scope criteria

A.2 Applying for DTRA CBEP Research Funding

CBEP Research Objectives and Scope

DTRA CBEP is continuously seeking new collaborators, partners and international partners to conduct cooperative biological research to inform and enhance disease surveillance and global health security. Projects that are hypothesis-driven and contain substantive engagement with and contribution by partner country institutions and scientists are appropriate for CBEP research funding. Research projects that support CBEP objectives in partner countries include those that promote One Health, improve disease surveillance, enhance understanding of endemic pathogens, explore the microbial ecology of endemic organisms, and enhance host country capabilities in support of World Health Organization International Health Regulations and World Organization for Animal Health reporting standards. Pathogens of interest include Biological Select Agents and Toxins, pathogens of pandemic potential, emerging and re-emerging infectious diseases, and pathogens that are co-syndromic with associated select agent etiologies such as Influenza-Like Illness or Acute Febrile Illness. CBEP does not support research topics that involve Dual- Use Research of Concern or focus on disease agents that are sexually transmitted, non-infectious, or do not pose a threat to global health security.

Research projects supported by CBEP must align with CBEP's overarching goals to reduce the threat to U.S. and global health security and are expected to produce results suitable for scientific publication.

Applying to the Broad Agency Announcement (BAA) and Government Call

CBEP welcomes research funding applications from domestic and foreign academic, private, and government institutions, and has multiple solicitations available for proposals.

- Academic institutions, non-governmental organizations, industry, foreign laboratory equivalents, and members of the private sector must apply through Thrust Area 6: Cooperative Counter Weapons of Mass Destruction (CWMD) Research with Global Partners of the Fundamental Research to Counter Weapons of Mass Destruction (FRCWMD) – BAA (HDTRA1-14-24- FRCWMD-BAA).
- U.S. Government partners and Federally Funded Research and Development Centers (FFRDCs) must apply through Thrust Area 6 of the FRCWMD Government Call (HDTRA1-12-17- FRCWMD-Call).

All research ideas MUST be pre-coordinated through submission of an abstract to FRCWMD-TA6@dtra.mil prior to submitting a white paper. White papers (aka Phase I proposal) must be submitted and a full proposal (aka Phase 2 Proposal) invited prior to submission of a full proposal. Phase 1 and Phase 2 proposals to the FRCWMD-BAA must be submitted through www.grants.gov. Phase 1 and Phase 2 proposals to the FRCWMD-Call must be submitted through www.dtrasubmission.net. White papers and proposals will be peer reviewed in accordance with the evaluation criteria published in the

BAA and Call and in coordination with appropriate CBEP Regional and Country Managers. To be successful, a white paper and/or proposal must align with both the DTRA/SCC-WMD CBEP mission and regional priorities.

Detailed instructions for the FRCWMD-BAA and the FRCWMD-Call can be found through the solicitation links at www.dtrasubmission.net. Please ensure that you are downloading and reviewing the latest amended full announcement for the most accurate information and instructions. Offerors may submit questions of an administrative nature to HDTRA1-FRCWMD-A@dtra.mil, and of a technical nature to FRCWMD-TA6@dtra.mil.

Dear Megan et al.
Regrettably I can't attend this time, as this falls just at the start up of a field project in Sabah.

Best wishes
Tigga

Subject: BOHRN Steering Committee/One Health Congress Meeting

All,

You are receiving this email, as part of a save the date to attend our BOHRN Steering Committee meeting and the 5th International One Health Congress (OHC) in Saskatoon, Canada.

Our meeting will take place on 20-21 June (location TBD, though likely at the Hilton Garden Inn). The agenda and travel information for this two day event will follow shortly. The OHC will take place 22-25 June.

On behalf of Dr. Marty Stoke and Dr. Mary Lancaster, CBEP will provide funding your travel and registration to the OHC and BOHRN Planning Meeting. While the OHC is not required it would be a good opportunity for networking on behalf of BOHRN. CBEP will be paying for OHC attendance next week. **Therefore, we need you to confirm your attendance to the OHC NLT tomorrow 23 March.** However, please note if regulations for DoD travel are not met by the specified due date, funding for the conference and travel will not be provided.

Please respond with your availability to attend the meeting NLT 23 March.

v/r,

Megan

Thanks Katie,

Very glad to see the PENAPH meeting selected. For the record I support the first name:
Bat-associated Pathogen and Ecology Research Network (BPERN) and strongly oppose the second name - we are not an "Alliance for Pathogens" - i.e., in support of pathogens - which is how this grammatically reads.

Looking forward to seeing everyone again.

Regards - DeeAnn

Subject: GBA Update and Request

All,

On behalf of Dr. Mary Lancaster and Dr. Marty Stokes, we would like to thank everyone, for your responses over the last couple weeks! Based on your feedback, we have a few announcements and one request:

Based on committee consensus, the group chose our next event to coincide with the Participatory Epidemiology Network for Animal and Public Health (PENAPH) on 10-12 January 2018, in Khon Kaen, Thailand. Details will be forthcoming, but please visit the hyperlink for further information (https://penaph.net/second-penaph-conference-participatory-approaches-in-animal-health-public-health-one-health-and-ecohealth/).

We did not receive additional nominations to serve as co-chairs, so we are pleased to announce our first Steering Committee Co-chairs: Dr. Jon Epstein from EcoHealth Alliance and Dr. Vivek Kapur from Penn State University. We will be setting up coordination calls with our two co-chairs, so you can expect communication and direction from them in the future.

Finally, one request; we did not have a majority vote selection for our organization's name, which leaves us with two options:

Option 1 Bat-associated Pathogen and Ecology Research Network (BPERN) and

Option 2 Global Alliance for Bat-borne Pathogens (GABP).

Please respond to this email with your selection no later than 24 August. We will tally the votes and make an announcement thereafter.

Thank you, again, for signing up to the APAN site and being so responsive to the request. We will be loading the first documents and drafts to the site (e.g., the TORFTA and community fact sheet) in the next couple weeks. You may expect email from us with information concerning our next meeting in January and planning discussions leading up to that meeting.

Subject: Re: GBA Update and Request

Dear Katie,

Happy to read that we are advancing. Good that Thailand is the next meeting venue.
For the selection, I was at the point of suggesting, if allowed, a combination of both as

Global Alliance for Bat-borne Pathogens and Ecological Research (GABPER)

However, to respond to your request, let me go forOption 2: Global Alliance for Bat-borne Pathogens (GABP)

Kind regards

Subject: Re: GBA Update and Request

Dear Katie and all,

First off, congratulations to Jon and Vivek, very happy to see them both selected as our first co-chairs!

Unfortunately I have another meeting in Europe the week of Jan 10th, so will likely be unable to make Khon Kaen.

As for the name, I'll cast a vote for #1. One option to alleviate DeeAnn's valid concerns about grammar would be to add the word research to the end of option #2. e.gGlobal Alliance for Bat-borne Pathogens Research (GABPR). Just a suggestion.

Best regards,
Kevin

Subject: Re: GBA Update and Request

Dear Katie and all,

First off, congratulations to Jon and Vivek, very happy to see them both selected as our first co-chairs!

Unfortunately I have another meeting in Europe the week of Jan 10th, so will likely be unable to make Khon Kaen.

As for the name, I'll cast a vote for #1. One option to alleviate DeeAnn's valid concerns about grammar would be to add the word research to the end of option #2. e.g. Global Alliance for Bat-borne Pathogens Research (GABPR). Just a suggestion.

Best regards,
Kevin

Dear Katie

Great that next meeting will be Thailand, PENAPH
Due to Dr Reeder concern that we are not an "Alliance for Pathogens", I will change my preference and will support for BPERN

Best regards
Lela

Subject: Re: GBA Update and Request

Dear Colleagues,

Glad to see the PENAPH meeting selected.

As for the name, I vote for option #1, however Option 2 with the modification - "Global Alliance for Bat-borne Pathogens Research" is also good.

Best regards,

Tamar Kutateladze
NCDC&PH,Tbilisi,Georgia

All,

On behalf of Dr. Mary Lancaster and Dr. Marty Stokes, we would like to thank everyone, for your responses over the last couple weeks! Based on your feedback, we have a few announcements and one request:

Based on committee consensus, the group chose our next event to coincide with the Participatory Epidemiology Network for Animal and Public Health (PENAPH) on 10-12 January 2018, in Khon Kaen, Thailand. Details will be forthcoming, but please visit the hyperlink for further information (https://penaph.net/second-penaph-conference-participatory-approaches-in-animal-health-public-health-one-health-and-ecohealth/).

We did not receive additional nominations to serve as co-chairs, so we are pleased to announce our first Steering Committee Co-chairs: Dr. Jon Epstein from EcoHealth Alliance and Dr. Vivek Kapur from Penn State University. We will be setting up coordination calls with our two co-chairs, so you can expect communication and direction from them in the future.

Finally, one request; we did not have a majority vote selection for our organization's name, which leaves us with two options:

Option 1 Bat-associated Pathogen and Ecology Research Network (BPERN) and

Option 2 Global Alliance for Bat-borne Pathogens (GABP).

Please respond to this email with your selection no later than 24 August. We will tally the votes and make an announcement thereafter.

Thank you, again, for signing up to the APAN site and being so responsive to the request. We will be loading the first documents and drafts to the site (e.g., the TORFTA and community fact sheet) in the next couple weeks. You may expect email from us with information concerning our next meeting in January and planning discussions leading up to that meeting.

Subject: Re: Global Bat Alliance Follow-up

Hi, Kevin. I will not speak for Marty and Mary here, but I think we are open to your suggestions. The intent is to capture a global picture of research, researchers, and networks, so we can better see where there are gaps, and where to target investments. At some point, we envision turning this into a database with a map overlay, so the more inclusive the better.

Thanks!

Katie

Thanks for this Katie. What are your criteria for inclusion here? We have been keeping track of a bunch of bat disease studies for various project here at EcoHealth Alliance, so would be happy to advise and contribute to this list depending on how inclusive you want to be - there will be 100s of papers!

Cheers,
Kevin

Subject: Update to the BPERNet Slides

Hi, everyone! We made a couple changes to the slides for tomorrow. Nothing substantive, just our approach to conducting the brief-out discussions and the order of a couple of the initial slides.

A reminder again to please be in the lobby at 0745, the bus will depart for Chulalongkorn promptly at 0800.

V/r,

Katie Leahy

Subject: BPERNet: Transportation Times and Other Useful Information (30 and 31 January 2017)

Hello, everyone! Welcome to Bangkok. On behalf of the Executive Committee (Dr. Martha Stokes and Dr. Mary Lancaster), we are so pleased that you are able to join us this week for our BPERNet planning meeting and other PMAC activities.

Please use this email as your resource for information regarding transportation, logistics, and other coordinating information for 30 January – 31 January.

30 January – BPERNet Meeting at Chulalongkorn Hospital

1. **The bus will depart from the Renaissance Hotel promptly at 0800** ; please be in the lobby for head count at 0745
2. We will provide coffee and light refreshment during the meeting; you will take lunch at one of the many canteen options at the hotel; please bring about 200 - 300 thai baht (~10 USD) for lunch

31 January – PMAC / BPERNet Field Trip

1. **The bus will depart from the Renaissance Hotel promptly at 0630** ; please be in the lobby for head count at 0615; please make sure that you are on time, as we are caravanning with a delegation from the Centara Hotel and will receive a police escort to move us quickly through traffic
2. We will provide a box breakfast for the bus ride
3. Please make sure that you dress appropriately for this field trip; we strongly suggest covered shoes and loose, comfortable clothing; in addition to this mode of dress we also suggest that you bring accompaniments for spending a day outdoors amongst bat roosts; such as:
    a. Hat
    b. Sunscreen
    c. Sunglasses
    d. Bug spray
    e. Water bottle

We will provide information regarding the Ambassador's reception at the close of tomorrow's meeting.

Again, we are so excited to have you all here. Please do not hesitate to reach out to me or Megan Hudson (copied) if you have any questions.

V/r,

Katie Leahy

Subject: Bat ID Symposium logistics

Dear Colleagues,

The symposium is one week away and I want to provide you with some logistical information for your arrival to Fort Collins.

1. Speakers. If you can email your presentation directly to me I will get it on the computer for the presentation.**However, the file size must be less than 15 MB to accommodate our email server limit**. Otherwise, please bring your presentation on a USB drive if it is larger than 15 mb. We will have both Microsoft Power Point and Apple Keynote software for your presentations. **Bring your USB drive to the Thursday evening reception if you want to transfer it then.**

2. Poster presenters. The maximum size of the posters is 48" x 48" (120 cm x 120 cm). We will provide push pins to mount your poster on the easels. When you register, your poster will have a number assigned to it that corresponds to the easel number. Please mount your poster on that easel. **Bring your poster to the Thursday evening reception.**

3. Getting to Fort Collins. Those of you who are flying to Denver International Airport can schedule a ride with the**Green Ride Airport Shuttle** service. Please visit its web site (https://greenrideco.hudsonltd.net/) to make arrangements convenient for your flight schedules. There is a Green Ride desk in the main terminal at the airport with employees that can help you find the bus pickup. The bus ride is about 1 hour and 15 minutes. On the web site, in the box "Dropoff location" choose the appropriate destination from the pull-down menu. For those of you staying in the university dormitories it is "FC - Laurel Village", the Hilton Hotel near campus is "FC - Hilton Ft Collins", and the University Inn is "FC - Best Western University Inn". And just to make you aware, afternoon and evening flights into Denver can be rather bumpy!

4. Weather and Climate. Fort Collins has lots of sunshine and is at 5000 ft/1500 meters. If you intend to be outdoors much you should bring sunscreen. We often get afternoon thunder showers in our otherwise dry climate but they are typically not more than an hour or two and it usually clears up afterwards. You may want to bring rain gear or a small umbrella. The current forecast is for the mid to high 80sF/low 30sC.

5. Getting to the UCA. The conference venue is the **University Center for the Arts (UCA)** (attached map, blue box, lower right). Oral and poster presentations will be in this building and directions will be posted inside. After you get settled in Thursday, please come to the UCA for the opening registration and social mixer by 5:30 PM. Walking paths (routes) are noted in blue hatched lines.

A. Laurel Village Alpine Dormitory. Those who are staying in campus housing, walk south to Plum Street and turn east to Meridian Avenue. Take Meridian Avenue south to Pitkin Street and take it east to Mason Street. Cross the railroad tracks and immediately turn right (south) just before the parking garage. Follow the path to just past the parking garage and turn left (east). This path leads to a **tunnel that passes under College Avenue** and comes out at the University Test Gardens (lots of flowers). Continue on this path and it will cross Remington Street to the UCA. **Allow 15-20 minutes to walk**.

B. Hilton Hotel. Proceed from the hotel to Prospect and Centre Avenue at the northwest corner of the Hilton Hotel parking lot. Cross

Centre to the west and **take the tunnel under Prospect Avenue**. At Lake Street, turn right (east) to Mason Street. Cross the railroad tracks and immediately turn left (north). Just before the parking garage, turn right (east) and take the path that leads to a **tunnel that passes under College Avenue** and comes out at the University Test Gardens. Continue on this path and it will cross Remington Street to the UCA. **Allow 10 minutes to walk**.

C. University Inn Best Western Hotel. Take Elizabeth Street east to Remington Street (one block). Turn right (south) to Pitkin Street. Once you cross Pitkin Street, the University Center for the Arts is to your left. **Allow 5 minutes to walk.**

6. Registration packet. Your registration packet will include the program, name badge, water bottle and a pass for the Fort Collins MAX bus. The pass allows you to ride the bus through Saturday night. Registration also includes lunch for Friday and Saturday. If you are staying in the dorms you will also have breakfast provided at the dorm dining hall, Corbett Hall, which is just east of Alpine Hall where you are staying (please see the attached map).

If you have questions, please contact me and I will address them. Finally, I will be at the American Society for Virology meeting Saturday through Wednesday so my email access may be intermittent.

Thanks and see you next week.

8:10 a.m. Session I - Filoviruses (Joseph Prescott, Moderator)

8:10 a.m. **Studies of horizontal transmission of Marburg virus among experimentally infected fruit bats**
Jonathan S. Towner[1,2], Amy J. Schuh[1], Brian R. Amman[1], Megan E. B. Jones[1,2], Tara K. Sealy[1], Uebelhoer LS, Spengler JR, Stuart T. Nichol[1]

[1]Viral Special Pathogens Branch, Centers for Disease Control and Prevention, Atlanta, USA, [2]Department of Pathology, College of Veterinary Medicine, University of Georgia, Athens, USA

8:30 a.m. **Investigations of Long-term Protective Immunity against Marburg Virus Reinfection in Egyptian Rousette Bats**
Amy Schuh, Amman BR, Sealy TK, Spengler JR, Nichol ST and Towner JS

Viral Special Pathogens Branch, Division of High-Consequence Pathogens and Pathology, Centers for Disease Control and Prevention, Atlanta, GA 30333, USA

8:45 a.m. **Innate immune response to filoviruses and the role of filoviral interferon-inhibiting domains in bat and human cells**
Ivan V. Kuzmin[1,2], Toni M. Schwarz[3], Philipp A. Ilinykh[1,2], Ingo Jordan[4], Thomas G. Ksiazek[1,2,5], Ravi Sachidanandam[6], Christopher F. Basler[3, 7], and Alexander Bukreyev[1,2,5]

[1] Department of Pathology, The University of Texas Medical Branch, Galveston, Texas, USA; [2] Galveston National Laboratory, The University of Texas Medical Branch, Galveston, Texas, USA; [3] Department of Microbiology, Icahn School of Medicine at Mount Sinai, New York, New York, USA; [4] ProBioGen AG, Berlin, Germany; [5] Department Microbiology & Immunology, The University of Texas Medical Branch, Galveston, Texas, USA; [6] Department of Oncological Sciences, Icahn School of Medicine at Mount Sinai, New York, New York, USA; [7] Current Address: Center for Microbial Pathogenesis, Institute for Biomedical Sciences, Georgia Research Alliance, Eminent Scholar in Virology, Georgia State University, Atlanta, Georgia, USA

9:00 a.m. **Broad based surveillance for ebolaviruses: PREDICT in Sierra Leone, Liberia, and Guinea.**
Brian Bird[1], Goldstein T[1], Anthony S[2], Gbakima A[3], Saylors K[3], Jean Louis F[3], Wolking D[1], Epstein J[4], Karesh W[4], Kreuder-Johnson C[1], Mazet J[1]

One Health Institute UC Davis School of Veterinary Medicine[1], Center for Infection and Immunity Columbia University[2], Metabiota Inc.[3], EcoHealth Alliance[4]

9:15 a.m. **Quantifying signatures of resistance and tolerance to filoviruses in bat cell lines**
Cara E. Brook[1], Melinda Ng[2], Esther Ndungo, Rohit K. Jangra, Andrew P. Dobson, Andrea L. Graham, Bryan T. Grenfell, C. Jessica E. Metcalf[1]*, Kartik Chandran[1]*
[1]Department of Ecology and Evolutionary Biology, Princeton University;
[2]Department of Microbiology and Immunology, Albert Einstein College of Medicine
*These senior authors contributed equally to this work.

9:30 a.m. **Serologic evidence of exposure to filoviruses in fruit bats, Singapore**
Laing ED[1], Ian H Mendenhall[2], Linster M[2], Low DHW[2], Chen Y[2], Yan L[1], Sterling SL[1], Borthwick S[2], Neves ES[2], Lim JSL[2], Skiles M[2], Lee BPY[4], Wang LF[2], Broder CC[1], Smith GJD[2, 5]

Uniformed Services University, Bethesda, MD, USA[1], Duke-National University of Singapore Medical School, Singapore[2], North Carolina State University, Raleigh, NC, USA[3], National Parks Board, Singapore[4], Duke Global Health Institute, Duke University, Durham, North Carolina, USA[5]

9:45 a.m. **Predicting undiscovered filovirus reservoirs and patterns of disease emergence**
David Hayman

Molecular Epidemiology and Public Health Laboratory, Hopkirk Research Institute, Massey University, New Zealand

10:00 a.m. Break

10:30 a.m. Session II - Coronaviruses A (Joel Rovnak, Moderator)

10:30 a.m. **Bats as possible animal origin of MERS-CoV**
Susanna K. P. Lau

Department of Microbiology, The University of Hong Kong, Hong Kong, China

10:45 a.m. **Rapid detection of MERS coronavirus ancestors in bats**
Prof. Patrick CY Woo

Department of Microbiology, The University of Hong Kong, Hong Kong.

11:00 a.m. **Global patterns in coronavirus diversity**
Simon J Anthony[1,2,3]; Johnson, C.K[4]; Greig, D.J[4]; Kramer, S[1,5]; Che, X[1]; Wells, H[1]; Hicks, A.L[1]; Joly, D.O[6, 7]; Wolfe, N.D[6]; Daszak, P[3]; Karesh, W[3]; Lipkin, W.I[1,2]; Morse, S.S[2]; PREDICT Consortium[8]; Mazet, J.A.K[4]; Goldstein, T[4]

One Sutter, Suite 600, San Francisco, CA, 94104 (USA); [7]Wildlife Conservation Society, New York, NY, (USA)

11:15 a.m. **SARS coronavirus may have originated from frequent recombination events between SARS-like coronaviruses in a single horseshoe bat habitat**
Ben Hu[1], Lei-Ping Zeng[1], Xing-Lou Yang[1], Xing-Yi Ge[1], Wei Zhang[1], Bei Li[1], Dong-Sheng Luo[1], Yun-Zhi Zhang[2], Mei-Niang Wang[1], Peter Daszak[3], Lin-Fa Wang[4], Jie Cui[1], Zheng-Li Shi[1]

[1] CAS Key Laboratory of Special Pathogens and Biosafety, Center for Emerging Infectious Diseases, Wuhan Institute of Virology, Chinese Academy of Sciences, Wuhan, China; [2]Yunnan Institute of Endemic Diseases Control and Prevention, Dali, China; [3]EcoHealth Alliance, New York City, New York, USA; [4]Programme in Emerging Infectious Diseases, Duke-NUS Medical School, Singapore.

11:30 a.m. **A metagenomic approach identifying a MERS-related coronavirus in a bat from South Africa**
Marike Geldenhuys[1], Marinda Mortlock[1], Jaqueline Weyer[2], Oliver Bezuidt[3], Ernest Seamark[4], Teresa Kearney[5,6], Cheryl Gleasner [7], Tracey Erkkila[7], Helen Cui[7] and Wanda Markotter[1]

[1] Centre for Viral Zoonosis, Department of Medical Virology, Faculty of Health sciences, University of Pretoria, Pretoria, South Africa. [2] Centre for Emerging, Zoonotic and Parasitic Diseases,

National Institute for Communicable Diseases, Sandringham, South Africa. [3] Centre for Microbial Ecology and Genomics, University of Pretoria, Pretoria, South Africa. [4] AfricanBats NPC, South Africa and Centre for Wildlife Management, University of Pretoria, Pretoria, South Africa. [5] Animal, Plant and Environmental Sciences, University of the Witwatersrand, Johannesburg, South Africa

12:00 p.m. Lunch and Poster Session

2:00 p.m. Session III - Rhabdoviruses (Ashley Malmlov, Moderator)

2:00 p.m. **New insights into the antiviral innate immune response of *Desmodus rotundus***
Sarkis Sarkis, Marie-Claude Lise, Edith Darcissac, Stéphanie Dabo, Christine Neuveut, Benoît de Thoisy, Eliane Meurs, Anne Lavergne and Vincent Lacoste

Institut Pasteur de la Guyane, French Guiana/ France

2:15 p.m. **A comparative study of the autophagy pathway during virus infection of bat (natural) and human (accidental) host cells**
Eric D. Laing[1], Spencer L. Sterling[1], Dawn L. Weir[1], Sasha E. Larsen[2], Linfa Wang[3], Brian C. Schaefer[1], and Christopher C. Broder[1]

[1]Department of Microbiology, Uniformed Services University, Bethesda, MD, USA; [2]Department of Pharmacology, Uniformed Services University, Bethesda, MD, USA; [3]Programme in Emerging Infectious Diseases, Duke-NUS Medical School, Singapore

2:30 p.m. **Lagos bat virus in South Africa, 2013-2017**
Jessica Coertse[1], Le Roux, K.[2], Richardson, E.[3], White, W.[3], Markotter, W.[1]

[1]Centre for Viral Zoonoses, Department of Medical Virology, Faculty of Health Sciences, University of Pretoria, South Africa; [2]Allerton Provincial Veterinary Laboratory, Pietermaritzburg, KwaZulu-Natal, South Africa; [3]KwaZulu-Natal Bat Interest Group, KwaZulu-Natal, South Africa

2:45 p.m. **Characterization of a novel Rhabdovirus isolated from insectivorous bat (*Pipistrellus kuhlii*) in Italy**
Davide Lelli[1], Alice Prosperi[1], Chiara Chiapponi[1], Paola Debenedictis[2], Anna Maria Gibellini[3], Stefania Leopardi[2], Enrica Sozzi[1], Dino Scaravelli[4], Ana Moreno[1], Antonio Lavazza[1]

[1]Istituto Zooprofilattico Sperimentale della Lombardia e dell'Emilia Romagna, Via Bianchi 9 - 25124 Brescia, Italy; [2]Istituto Zooprofilattico Sperimentale delle Venezie, OIE Collaborating Centre and National Reference Centre for Research on Infectious Diseases at the Animal-Human Interface, Viale dell'Università 10 - 35020 Legnaro (PD), Italy; [3]Wildlife Rehabilitation Center WWF of Valpredina via Pioda n.1, 24060 Cenate Sopra(BG), Italy; [4]University of Bologna, Department of Veterinary Medical Sciences, via Tolara di sopra 50 - 40064 Ozzano Emilia (BO), Italy

3:00 p.m. Session IV - Paramyxoviruses (Danielle Adney, Moderator)

3:00 p.m. **Age-specific dynamics of maternally- and infection- derived immunity within African bat populations**
Alison J Peel[1], Kate S Baker[2], David TS Hayman[3], Andrew A Cunningham[4], James LN Wood[5], Romain Garnier[5] and Olivier Restif[5]
[1] Environmental Futures Research Institute, Griffith University, Nathan, QLD, Australia; [2] Institute for Integrative Biology, University of Liverpool, UK; [3] Molecular Epidemiology and Public Health Laboratory, Hopkirk Research Institute, Massey University, Palmerston North, New Zealand; [4] Institute of Zoology, Zoological Society of London, Regent's Park, London, UK; [5] Department of Veterinary Medicine, University of Cambridge, Cambridge, UK

3:15 p.m. **Detection of rubula- and related viruses in an Egyptian fruit bat (*Rousettus aegyptiacus*) colony in South Africa**
Marinda Mortlock[1], Jacqueline Weyer[2], Janusz Paweska[2] and Wanda Markotter[1]

[1]Centre for Viral Zoonoses, Department of Medical Virology, Faculty of Health Science, University of Pretoria, South Africa; [2]Centre for Emerging, Zoonotic and Parasitic Diseases, National Institute for Communicable Diseases, Sandringham, Johannesburg, South Africa

3:30 p.m. Break

4:00 p.m. **Influenza-like virus and paramyxovirus screening in Brazilian bats**

Angélica Cristine Campos[1]; Luiz Gustavo Góes[1]; Cristiano Carvalho[2]; Guilherme Ambar[5]; Luciano M. Thomazelli[1]; Jhiovana Cristielly Costa[1]; Mariana Cristine de Souza[1]; Adriana Ruckert[3]; Débora C. Oliveira[3]; Luzia F. Martorelli[3]; Ana Paula Kataoka[3]; Marcelo S. Nardi[4]; Juliana L. Summa[4]; Roberta Marcatti de Azevedo[4]; Wagner A. Pedro[2]; Luzia H. Queiroz[2]; Ariovaldo P. Cruz-Neto[5] and Edison Durigon[1]

[1] Departamento de Microbiologia, Instituto de Ciências Biomédicas (ICB), Universidade de São Paulo (USP), São Paulo-SP; [2] Faculdade de Medicina Veterinária de Araçatuba, Universidade Estadual Paulista (UNESP), Araçatuba- SP; [3] Centro de Controle de Zoonozes (CCZ) do Município de São Paulo-SP; [4] Divisão Técnica de Medicina Veterinária e Manejo da Fauna Silvestre (DEPAVE-3), Secretaria do Verde e Meio Ambiente, Prefeitura do Município de São Paulo, São Paulo-SP; [5] Departamento de Zoologia, Instituto de Biociências, Universidade Estadual Paulista (UNESP), Rio Claro-SP

4:15 p.m. **Hendra virus dynamics and spillover**

Raina Plowright[1], Maureen Kessler[1], Alison Peel[2], Hamish McCallum[2], Peggy Eby[3]

[1]Department of Microbiology and Immunology, Montana State University; [2]Environmental Futures Research Institute, Griffith University, Queensland, Australia; [3]University of New South Wales, Australia.

4:30 p.m. Session V - Methodology in Bat-borne Viruses (Danielle Adney, Moderator)

4:30 p.m. **Using serology to understand the dynamics of concurrent viral infections in pteropid bats**

Jonathan H. Epstein[1], Noam Ross[1], Ariful Islam[1], Dan Crowley[1,2], Gary Crameri[3], Christopher Broder[4], Linfa Wang[5], and Peter Daszak[1].

[1]EcoHealth Alliance, NY USA; [2]Columbia University Mailman School of Public Health, NY USA; [3]CSIRO Australian Animal Health Laboratory, Geelong, VIC, AUS; [4]Uniformed Services University, MD USA; [5]Duke-NUS, Singapore

4:45 p.m. **Estimating viral richness and viral sharing in bats: integrating previously-published and newly-acquired field data**

Kevin J. Olival[1], Noam Ross[1], Evan A. Eskew[1], Anna R. Willoughby[1], Carlos Zambrana-Torrelio[1], Peter Daszak[1], and PREDICT Consortium[2]

[1] EcoHealth Alliance, New York, NY 10001, USA; [2] http://www.vetmed.ucdavis.edu/ohi/predict/publications/Authorship.cfm

5:00 p.m. **Open Discussion**

6:00 p.m. Recess

Saturday, July 1

7:30 a.m. Registration, North Ballroom, University Center for the Arts

8:00 a.m. Session II - Coronaviruses B (Rebekah Kading, Moderator)

8:00 a.m. **Optimised sampling efforts and screening assays identify several MERS-related coronaviruses in South African bats**

Wolfgang Preiser[1,2], Ndapewa L. Ithete[1], Nadine Cronjé[1], Tasnim Suliman[1]

[1]Division of Medical Virology, Faculty of Medicine & Health Sciences, University of Stellenbosch, South Africa; [2]National Health Laboratory Service (NHLS) Tygerberg, Cape Town, South Africa

8:15 a.m. **Coronavirus diversity in bats from urban, rural and forest areas of Atlantic and Amazon Forest biomes, Brazil.**
Luiz Gustavo Góes[1]; Angélica Cristine Campos[1]; Cristiano Carvalho[2]; Guilherme Ambar[5]; Douglas Oliveira[1]; Caroline Alvarenga[1]; Jhiovana Cristielly Costa[1]; Adriana Ruckert[3]; Débora C. Oliveira[3]; Luzia F. Martorelli[3]; Ana Paula Kataoka[3]; Marcelo S. Nardi[4]; Juliana L. Summa[4]; Roberta Marcatti de Azevedo[4]; Luzia H. Queiroz[2]; Ariovaldo P. Cruz-Neto[5] and Edison Durigon[1]

[1]Departamento de Microbiologia, Instituto de Ciências Biomédicas (ICB), Universidade de São Paulo (USP), São Paulo-SP; [2] Faculdade de Medicina Veterinária de Araçatuba, Universidade Estadual Paulista (UNESP), Araçatuba- SP; [3] Centro de Controle de Zoonozes (CCZ) do Município de São Paulo-SP; [4] Divisão Técnica de Medicina Veterinária e Manejo da Fauna Silvestre (DEPAVE-3), Secretaria do Verde e Meio Ambiente, Prefeitura do Município de São Paulo, São Paulo-SP; [5] Departamento de Zoologia, Instituto de Biociências, Universidade Estadual Paulista (UNESP), Rio Claro-SP

8:30 a.m. **Preliminary Evidence of a Novel Alphacoronavirus and Secondary Acquisition of Tymoviridae and Partitiviridae in Little Brown Bats (*Myotis lucifugus*) in Southcentral Alaska.**
Douglas Causey[1], Jonathan C. Rupp*[1], Maegan Lange[1], Megan Howard[2], Anitha Sundarajan[3], Jonny Sena[3], Faye D. Schilkey[3], Molly Murphy[4], Sarah Cooperman[1], Eric Bortz[1]

[1]Dept. of Biological Sciences, University of Alaska Anchorage; [2]Battelle Memorial Institute; [3]National Center for Genome Resources, Santa Fe NM; [4]Dept. of Veterinary Medicine, University of Alaska Fairbanks

8:45 a.m. **Are big brown bat cells different than human cells in their innate immune response to coronavirus and viral ligands?**
Arinjay Banerjee[1], Robert Brownlie[3], Noreen Rapin[1], Trent Bollinger[2], Darryl Falzarano[1,3] and Vikram Misra[1]

[1]Department of Microbiology, Western College of Veterinary Medicine, University of Saskatchewan, Canada. [2]Department of Pathology, Western College of Veterinary Medicine, University of Saskatchewan, Canada. [3]VIDO-InterVac, University of Saskatchewan, Canada.

9:00 a.m. **Session V - Influenza** (Corey Campbell, Moderator)

9:00 a.m. **Reverse genetic analysis of bat influenza viruses: A journey full of surprises.**
Martin Schwemmle

Institute of Virology, University of Freiburg Medical Center

9:30 a.m. **Towards understanding bat influenza A-like viruses**
Wenjun Ma[1], Bin Zhou[2], Jingjiao Ma[1], Qingfang Liu[1], Jinhwa Lee[1], Michael Duff[1], Juergen A. Richt[1], David E. Wentworth[2]
[1]Department of Diagnostic Medicine/Pathobiology, College of Veterinary Medicine, Kansas State University, Manhattan, Kansas, United States of America.
[2]Virology, J. Craig Venter Institute, Rockville, Maryland, United States of America.

9:45 a.m. **Experimental Infection of Jamaican Fruit Bats (*Artibeus jamaicensis*) with a Rescued Bat HL18NL11 Influenza A-like Virus**
Tony Schountz[1], Ashley Malmlov[1], Jingjiao Ma[2], Jinhwa Lee[2], Corey Campbell[1], Tawfik Aboellail[1], Ann Hawkinson[3] and Wenjun Ma[2]

[1]Department of Microbiology, Immunology and Pathology, College of Veterinary Medicine and Biomedical Sciences, Colorado State University; [2]Department of Diagnostic Medicine and Pathobiology, College of Veterinary Medicine, Kansas State University; [3]School of Biological Sciences, University of Northern Colorado

10:00 a.m. Break

10:00 a.m. Session VI - Ecology (Paul Cryan, Moderator)

10:30 a.m. **Seroprevalence of alphaviruses, flaviviruses and Rift Valley fever virus in Ugandan bats**
Rebekah C Kading[1,2], Kityo R[3], Mossel E[1], Borland E[1], Nakayiki T[4], Nalikka B[3], Nyakarahuka L[4], Ledermann J[1], Panella N[1], Gilbert A[5,6], Crabtree M[1], Kerbis Peterhans J[7], Towner J[8], Amman B[8], Sealy T[8], Nichol S[8], Powers A[1], Lutwama J[4], Miller B[1]

[1] Centers for Disease Control and Prevention, Division of Vector-borne Diseases, Arbovirus Diseases Branch, Fort Collins, CO. [2]Current Affiliation: Colorado State University, Department of Microbiology, Immunology and Pathology, Fort Collins, CO. [3]Makerere University, Department of Biological Sciences, Kampala, Uganda. [4]Uganda Virus Research Institute, Entebbe, Uganda. [5]Centers for Disease Control and Prevention, Division of High Consequence Pathogens, Rabies and Poxvirus Branch, Atlanta, GA. [6]Current Affiliation: United States Department of Agriculture, Animal and Plant Health Inspection Service, Fort Collins, CO. [7]College of Professional Studies, Roosevelt University &Collections & Research, The Field Museum of Natural History, Chicago, IL. [8]Centers for Disease Control and Prevention, Division of High Consequence Pathogens, Viral Special Pathogens Branch

10:45 a.m. **Presence of zoonotic bat pathogens correlate with reproductive seasons in South African bat populations**
Wanda Markotter[1], Muriel Dietrich[1], Teresa Kearney[2,3], Stewart McCulloch[1], Marinda Mortlock[1], Ernest Seamark[4,5] and Janusz Paweska[6]

[1] Centre for Viral Zoonoses, Department of Medical Virology, Faculty of Health Sciences, University of Pretoria, South Africa. [2] Ditsong National Museum of Natural History, Pretoria, South Africa. [3] Plant and Environmental Sciences, University of the Witwatersrand, Johannesburg, South Africa. [4] AfricanBats, Kloofsig, South Africa. [5] Centre for Wildlife Management, Faculty of Natural and Agricultural Sciences, University of Pretoria, Pretoria, South Africa. [6] Centre for Emerging, Zoonotic and Parasitic Diseases, National Institute for Communicable Diseases, Sandringham, South Africa.

11:00 a.m. **Body mass index of the Egyptian fruit bat, *Rousettus aegyptiacus*: An indicator of infection status**
Low J. de Vries[1], Stewart McCulloch[1], Janusz Paweska[2] and Wanda Markotter[1]

[1]Centre for Viral Zoonoses, Department of Medical Virology, Faculty for Health Science, University of Pretoria, South Africa; [2]Center for Emerging, Zoonotic and Parasitic Diseases, National Institute for Communicable Diseases, Sandringham, Johannesburg, South Africa

11:15 a.m. **Environmental constraints drive the viral diversity of two sympatric Amazonian bat species**
Arielle Salmier, Sourakhata Tirera, Benoit de Thoisy, Alain Franc, Edith Darcissac, Damien Donato, Christiane Bouchier, Vincent Lacoste and Anne Lavergne

Institut Pasteur de la Guyane, French Guiana/ France

11:30 a.m. **Seasonal and individual predictors of grey-headed flying fox (*Pteropus poliocephalus*) foraging movements in Adelaide, South Australia**
Cecilia A. Sánchez[1,2], Terry B. Reardon[3], Wayne S.J. Boardman[4] and Sonia Altizer[1,2]

[1]Odum School of Ecology, University of Georgia, Athens, GA, USA; [2]Center for the Ecology of Infectious Diseases, University of Georgia, Athens, GA, USA; [3]South Australian Museum, Adelaide, South Australia, Australia; [4]University of Adelaide, Adelaide, South Australia, Australia

11:45 a.m. **Uganda Bat calls library-developing a tool to survey arthropod-borne viruses associated with Chiroptera**
Robert Martin Kityo[1], Rebekah Kading[2], Betty Nalikka[1], Julius Lutwama[3]

[1]Makerere University, College of Natural Science – Department of Zoology, Entomology and Fisheries Science Kampala Uganda; [2]Colorado State University; [3]Uganda Virus research institute

12:00 p.m. Lunch

1:00 p.m. Session V - Immunology of Bats (Tony Schountz, Moderator)

1:00 p.m. **Dampening of STING-dependent IFN production: an implication of virus tolerance in bats?**
Jiazhen Xie[1], Chenxi Ma [1], Yang Li[1], Jie Cui[1], Linfa Wang [2], Zhengli Shi [1] and Peng Zhou[1*]

[1]Wuhan Institute of Virology, Chinese Academy of Sciences, Wuhan 430071, China; [2]Emerging Infectious programme, Singapore Duke-NUD Medical School, Singapore 169857, Singapore

1:15 p.m. **Regulation of immune activation and dampened inflammation in Pteropid bats**
Aaron T. Irving[1], Katarina Luko[1], Matae Ahn[1], Kong Pui San[1], & Lin-Fa Wang[1]

[1]Duke-NUS Medical School, Singapore

1:30 p.m. **Delineating the phenotype and function of the B cell population in the fruit-eating bat, *Pteropus Alecto.***
Pravin Periasamy[1,2], Martínez Gómez JM[1,2], Wang LF[3] , and Alonso S[1,2]

[1]Department of Microbiology and Immunology, [2]Immunology Programme, Yong Loo Lin School of Medicine, Life Sciences Institute, National University of Singapore, Singapore. [3]DUKE-NUS, Singapore.

1:45 p.m. **Integrative measures for assessing "health" in free-ranging bats – zoonotic and conservation implications from a One Health perspective**
DeeAnn M. Reeder, Kenneth A. Field

Department of Biology, Bucknell University

2:00 p.m. Session VI - White Nose Syndrome (Joel Rovnak, Moderator)

2:00 p.m. **Host-pathogen interactions during white-nose syndrome**
Ken Field[1], Sophia M Reeder[1], Jonathan M Palmer[2], Brent J Sewall[3], Jenni M Prokkola[4], Greg Turner[5], Thomas M Lilley[6], Marianne Gagnon[3], J Paul White[7], Joseph Johnson[8], Christopher Hauer[3], and DeeAnn M Reeder[2]

[1]Department of Biology, Bucknell University, Lewisburg, PA; [2]Center for Forest Mycology Research, Northern Research Station, US Forest Service, Madison, WI; [3]Department of Biology, Temple University, Philadelphia, PA; [4]University of Eastern Finland, Joensuu, Finland; [5]Wildlife Diversity Division, Pennsylvania Game Commission, Harrisburg, PA; [6]Institute of Integrative Biology, University of Liverpool, Liverpool L69 3BX, UK; [7]Wisconsin Department of Natural Resources, Madison, WI; [8]Biological Sciences, Ohio University, Athens, OH

2:15 p.m. **Resistance or Tolerance – How do European bats cope with *Pseudogymnoascus destructans*?**
Marcus Fritze[1,2],Voight CC[2], Czirjak GA[2], Puechmaille SJ[1,3]

[1] Zoology Institute,University of Greifswald,Soldmann-Str. 14, D - 17487 Greifswald, Germany; [2] Leibniz institute for Zoo and Wildlife Research, Alfred-Kowalke-Str. 17, 10315 Berlin, Germany and [3]School of Biology and Environmental Sciences, University College Dublin, Belfield, D4 Dublin Ireland

2:30 p.m. **Modeling the impact of White-nose syndrome on two western bat species**
C. Reed Hranac[1], Brandon J. Klüg-Baerwald[2], Yvonne A. Dzal[3], Cori Lausen[4], Jonathan C. Marshall[1,5], Sarah H. Olson[6] , David T. S. Hayman[1]

2:45 p.m. **Variable behaviors influence species susceptibility to disease – surviving white-nose syndrome.**
Paul M. Cryan

U.S. Geological Survey (USGS), USGS Fort Collins Science Center, 2150 Centre Ave., Bldg. C, Fort Collins, Colorado

3:00 p.m. Break

3:30 p.m. Session VI - Other Infectious Agents of Bats (Anna Fagre, Moderator)

3:00 p.m. **Emerging Insights into the Geographic Distribution, Genetic Diversity and Evolutionary Origin of Bat-borne Hantaviruses**
Satoru Arai[1], Se Hun Gu[2], Son Truong Nguyen[3], Vuong Tan Tu[3], Blaise Kadjo[4], Burton K. Lim[5], Joseph S. Masangkay[6], Saw Bawm[7], Joseph A. Cook[8], Shigeru Kyuwa[9], Keiko Tanaka-Taya[1], Shigeru Morikawa[1] and Richard Yanagihara[2]

[1]National Institute of Infectious Diseases, Tokyo, Japan; [2]University of Hawaii at Manoa, Honolulu, HI, USA; [3]Institute of Ecology and Biological Resources, Vietnam Academy of Science and Technology, Hanoi, Vietnam; [4]University of Félix Houphouët-Boigny, Abidjan, Côte d'Ivoire; [5]Royal Ontario Museum, Toronto, Canada; [6]University of the Philippines Los Baños, Laguna, Philippines; [7]University of Veterinary Science, Nay Pyi Taw, Myanmar; [8]University of New Mexico, Albuquerque, New Mexico, U.S.A.; [9]University of Tokyo, Tokyo, Japan;

3:15 p.m. **Neotropical Bats that Co-habit with Humans Function as Dead-End Hosts for Dengue Virus**
Amanda Vicente-Santos[1,2], Andres Moreira-Soto[1,4], Claudio Soto-Garita[1], Luis Guillermo Chaverri[3], Andrea Chaves[2], Jan Felix Drexler[4,5], Juan Alberto Morales[6], Alejandro Alfaro-Alarcón[6], Bernal Rodríguez-Herrera [2] and Eugenia Corrales-Aguilar [1*]

[1]Virology-CIET (Research Center for Tropical Diseases), Microbiology, University of Costa Rica, San José, Costa Rica. [2]Biology, University of Costa Rica, San José, Costa Rica. Seasonal serological signals in viral infections for Madagascar fruit bats

Oral Presentation Abstracts

Studies of horizontal transmission of Marburg virus among experimentally infected fruit bats
Jonathan S. Towner[1,2], Amy J. Schuh[1], Brian R. Amman[1], Megan E. B. Jones[1,2], Tara K. Sealy[1], Uebelhoer LS, Spengler JR, Stuart T. Nichol[1]

[1]Viral Special Pathogens Branch, Centers for Disease Control and Prevention, Atlanta, USA, [2]Department of Pathology, College of Veterinary Medicine, University of Georgia, Athens, USA

Objectives: To investigate under experimental conditions the dynamics of Marburg virus replication in a known reservoir host and determine if 1) the virus can be transmitted from infected bats to immunologically naïve bats in the absence of arthropod vectors, and 2) identify the route(s) of virus shedding and therefore likely exposure. **Methods**: Using age-matched captive borne juvenile bats, we inoculated a total of 12 animals with Marburg virus 371 bat isolate and co-housed these animals with 24 naïve contact bats for 9 months under BSL-4 conditions and tested for evidence of virus shedding and transmission. **Results**: Marburg virus shedding was detected in oral, rectal and urine specimens from the inoculated bats through 19 days post infection. During the same time frame, Marburg virus was detected in oral specimens from contact bats, indicating that they were orally exposed to the virus from the inoculated animals. In the late study phase, we found that Marburg virus was horizontally transmitted from the donor bats to naïve contact bats by finding Marburg virus RNA in blood and oral specimens from contact bats, followed by the detection of Marburg virus IgG antibodies in these same animals. **Conclusions**: This study demonstrates, in the absence of any arthropod vectors, 1) direct filovirus transmission from a natural reservoir to another animal, 2) Marburg virus is shed primarily in saliva and urine, and perhaps feces, with some bats acting as super-shedders accounting for more than 80% of the cumulative virus shed, and 3) that this virus/reservoir host system can serve as an bona-fide experimental model for investigating how filoviruses are maintained long-term in nature and what drivers might influence occasional spillover to humans and other animals.

Investigations of Long-term Protective Immunity against Marburg Virus Reinfection in Egyptian Rousette Bats
Schuh AJ, Amman BR, Sealy TK, Spengler JR, Nichol ST and Towner JS

Viral Special Pathogens Branch, Division of High-Consequence Pathogens and Pathology, Centers for Disease Control and Prevention, Atlanta, GA 30333, USA

Objectives: The Egyptian rousette bat (ERB; *Rousettus aegyptiacus*) is as a known natural reservoir host for Marburg virus (MARV). Following infection of ERBs with MARV, virus-specific IgG antibodies rapidly decline and by 3 months post infection the bats are MARV seronegative. Therefore, it is unclear whether reinfection plays a role in MARV maintenance. **Methods:** To address this question, ERBs that had been “naturally” or experimentally infected with MARV 17 to 24 months prior were challenged with homologous virus. Following challenge, evidence of MARV replication in the blood and viral shedding from the oral mucosa was monitored for 14 days, MARV IgG antibody responses were monitored for 21 days and tissues obtained at necropsy at 21 days were tested for the presence of MARV RNA. **Results:** No evidence of MARV replication in the blood or shedding from the oral mucosa was detected in either group of bats through 14 days post inoculation. A robust MARV IgG antibody response occurred by seven days post inoculation in all bats, indicating the occurrence of a secondary immune response. **Conclusions:** This study demonstrates that both “natural” and experimental infection of ERBs with MARV induces long-term protective immunity against reinfection and suggests that other factors such as the twice-yearly influx of susceptible juveniles, large colony sizes and population connectivity, drive MARV transmission dynamics in wild populations of ERBs.

Innate immune response to filoviruses and the role of filoviral interferon-inhibiting domains in bat and human cells
Ivan V. Kuzmin[1,2], Toni M. Schwarz[3], Philipp A. Ilinykh[1,2], Ingo Jordan[4], Thomas G. Ksiazek[1,2,5], Ravi Sachidanandam[6], Christopher F. Basler[3, 7], and Alexander Bukreyev[1,2,5]

[1] Department of Pathology, The University of Texas Medical Branch, Galveston, Texas, USA, [2] Galveston National Laboratory, The University of Texas Medical Branch, Galveston, Texas, USA; [3] Department of Microbiology, Icahn School of Medicine at Mount Sinai, New York, New York, USA; [4] ProBioGen AG, Berlin, Germany; [5] Department Microbiology & Immunology, The University of Texas Medical Branch, Galveston, Texas, USA; [6] Department of Oncological Sciences, Icahn School of Medicine at Mount Sinai, New York, New York, USA; [7] Current Address: Center for Microbial Pathogenesis, Institute for Biomedical Sciences, Georgia Research Alliance, Eminent Scholar in Virology, Georgia State University, Atlanta, Georgia, USA

Objectives: Innate immune responses in bat (Rousettus aegyptiacus) and human cells to the filoviruses Marburg (MARV) and Ebola (EBOV) were investigated to determine the ability of these viruses to subvert antiviral insults from different host species.
Methods: The innate immune response to filoviruses in bat and humans cells was profiled by deep sequencing and also analyzed by qRT-PCR. Bat mRNAs encoding IFNalpha, beta, gamma, lambda, and interferon stimulated genes (ISG) 54 and 56, were cloned and examined for their antiviral effect in response to MARV and EBOV infection in bat and human cells. Rates of infection and the effects of the major filoviral IFN-inhibiting domains (IID), VP35 and VP24, were analyzed in cells from both host species.
Results: We demonstrated that EBOV and MARV replicate to similar levels in all tested cell lines, indicating that permissiveness for EBOV at cell and organism levels do not necessarily correlate. Filoviruses, particularly MARV, induced a potent innate immune response in rousette cells that was generally stronger than in human cells. Both EBOV VP35 and VP24 IID were found to suppress the innate immune response in rousette cells, but only VP35 IID appeared to promote virus replication. Along with IFN-alpha and IFN-beta, IFN-gamma was demonstrated to control filovirus infection in bat cells but not in human cells suggesting host species specificity of the antiviral effect. The antiviral effects of bat IFNs appeared not to correlate with induction of bat ISG54 and ISG56, which were detected in human cells expressing bat IFN-alpha and IFN-beta.
Conclusions: Rousettus aegyptiacus cells mount robust innate immune responses to filovirus infection. Filovirus IIDs are active in both rousette and human cells; however, the VP35 IID plays a greater role in promotion of viral replication in rousette cells than in human cells. IFN-gamma plays a greater role in control of filovirus infections in rousette non-immune cells than in human cells. At least in part, the antiviral effect of IFN-gamma results from 'cross talk' leading to activation of the type I IFN response. The data are useful for understanding the interactions of filoviruses with natural (Rousettus aegyptiacus) and accidental hosts (humans).

Broad based surveillance for ebolaviruses: PREDICT in Sierra Leone, Liberia, and Guinea
Bird B[1], Goldstein T[1], Anthony S[2], Gbakima A[3], Saylors K[3], Jean Louis F[3], Wolking D[1], Epstein J[4], Karesh W[4], Kreuder-Johnson C[1], Mazet J[1]

Objectives: Developing and operationalizing strategies to reduce zoonotic pathogen spillover, amplification, and spread are nowhere more relevant than in Sierra Leone, Guinea, and Liberia. The devastating loss of lives associated with the Ebola virus outbreak revealed the urgent need for increased animal and public health sector capacity strengthening. Put into historical context, this epidemic was more than 60 times larger than any previous Ebola outbreak, spread to 7 additional countries, and stretched emergency response efforts to the utmost limits of capacity. **Methods**: PREDICT is working to improve understanding of wildlife reservoirs, spillover hosts, and origins of these viruses; ascertain the potential of virus-spillover into other non-typical hosts, such as livestock or companion animals; gain a greater understanding of high-risk human behavioral activities; and improve disease surveillance and laboratory capacities through workforce development in line with Global Health Security Agenda priorities. **Results**: Due to the impact on these three countries, USAID's PREDICT Project developed a focused effort to better address the threat of ebolaviruses by investigating the virus' animal origins, while strengthening in-country capacity to build and reinforce emerging disease surveillance and detection systems. In each country, teams are conducting concurrent sampling of from multiple animal taxa (dogs, cats, livestock, wildlife) and applying broad based molecular approaches to detect all known and other potential novel ebolaviruses. As of April 2017, over 6,500 animals have been sampled including over 3,500 bats in the three countries, with laboratory testing underway. Without identifying reservoirs of infection and how widely they are distributed across the region, prevention programs to reduce transmission from animals to people will have limited impact, and it is likely that future spillover of ebolaviruses from animals into humans will continue to occur. **Conclusions**: As we have seen over the years in Central and Eastern Africa where filovirus outbreaks have repeatedly occurred, effective control of these rare "spillover" events is possible and, when the right technical capacities are in place, these outbreaks can even be limited to a small number of human cases.

Quantifying signatures of resistance and tolerance to filoviruses in bat cell lines
Cara E. Brook[1], Melinda Ng[2], Esther Ndungo, Rohit K. Jangra, Andrew P. Dobson, Andrea L. Graham, Bryan T. Grenfell, C. Jessica E. Metcalf[1]*, Kartik Chandran[1]*

[1]Department of Ecology and Evolutionary Biology, Princeton University;
[2]Department of Microbiology and Immunology, Albert Einstein College of Medicine
*These senior authors contributed equally to this work.

Objectives: Previous work has demonstrated that a single amino acid change in the filovirus receptor, NPC1, in *Eidolon helvum* cells make them refractory to Ebola virus infection, hinting at a possible coevolutionary history between virus and bat host. We sought to expand on this nascent evidence of the evolution of pathogen resistance. **Methods:** We carried out a series of plaque assays, in which we challenged bat (EidNi/41.3, RoNi/7.1, PaKiT01), U2OS, and Vero cell lines with multicycle replicating pseudotype Ebola and Marburg filoviruses. Because of the agar overlay inherent to the plaque assay, viral transmission was restricted to neighboring cells. We visualized this transmission by photographing the timecourse of infection spread across the cell monolayer, and processing the images to quantify the proportion infected at a given time point as the proportion of photograph illuminated by GFP-tagged virus. We then fit spatially-structured traditional epidemiological models to the resulting data, in order to disentangle the mechanisms underpinning diverse trajectories of tolerance and resistance in different virus-cell line relationships. **Results:** Our modeling highlights diverse, species-specific evolutionary relationships between particular bat cell lines and particular filoviruses, which necessitate mechanisms of pathogen resistance in order to recapture data trajectories in some cases (chiefly *E. helvum* and Ebola and *P. alecto* and Marburg) and mechanisms of tolerance in others. **Conclusions:** Our work highlights the power of interdisciplinary approaches, combining quantitative epidemiology with cell biology and adds to growing evidence suggestive of unique species-specific coevolution between bats and filoviruses.

Serologic evidence of exposure to filoviruses in fruit bats, Singapore
Laing ED[1], Mendenhall IH[2], Linster M[2], Low DHW[2], Chen Y[2], Yan L[1], Sterling SL[1], Borthwick S[2], Neves ES[2], Lim JSL[2], Skiles M[2], Lee BPY[4], Wang LF[2], Broder CC[1], Smith GJD[2, 5]

Uniformed Services University, Bethesda, MD, USA[1], Duke-National University of Singapore Medical School, Singapore[2], North Carolina State University, Raleigh, NC, USA[3], National Parks Board, Singapore[4], Duke Global Health Institute, Duke University, Durham, North Carolina, USA[5]

Objectives: Bats are known natural hosts of Nipah virus and Maburg virus, and the collective evidence suggests that bats are also the natural hosts of ebolaviruses. Reston virus, an *Ebolavirus* species, is known to circulate in species of bats in the Philippines. To examine whether ebolaviruses and marburgviruses are more broadly present in Southeast Asia, we tested sera from three fruit bat species endemic in Singapore and widely distributed throughout Southeast Asia for evidence of past exposure to known species of ebolaviruses and marburgviruses. **Methods:** Sera were collected from the above-mentioned bat species from 2011 to 2016 in Singapore to screen for evidence of exposure to filoviruses. Venous blood was diluted 1:10 in 1×PBS and tested using a Bio-Plex® bead-based multiplex assay that simultaneously probes sera for immunoglobulins specific to the viral envelope glycoprotein from representative strains of all previously described *Ebolavirus* and *Marburgvirus* spp. We employed methods developed by Peel AJ *et al.* to establish a median fluorescence intensity (MFI) cutoff value. We screened 409 samples with this *Ebolavirus/Marburgvirus* spp. Bio-Plex® assay. **Results:** Positive results indicated that bats were previously infected with viruses related to the ebolaviruses from which the virus surface proteins were derived. Of the species tested, 10% of *Eoncyteris spelaea*, 8% of *Cynopterus brachyotis*, and 4% of *Penthetor lucasi* had positive sera results for antibodies specific to ebolaviruses.
Conclusion: These serological results demonstrated that viruses related to ebolaviruses have previously infected all three species of fruit bats, and may circulate in the populations, but we have not detected the virus in any samples. We conducted next generation sequencing on urine and feces, bat cell lines and screened numerous samples from bats in Singapore and have detected no evidence of the virus. As there is no evidence of Ebola virus disease in humans in Singapore or Southeast Asia, we think that these serological findings are evidence of novel, yet undescribed viruses related to known ebolaviruses.

Predicting undiscovered filovirus reservoirs and patterns of disease emergence
David Hayman[1]

[1]Molecular Epidemiology and Public Health Laboratory, Hopkirk Research Institute, Massey University, New Zealand

Objectives: How can we discover unidentified filovirus hosts and where should we be searching for the viruses? Filoviruses *Ebolavirus* (EBOV) and *Marburgvirus* cause hemorrhagic fevers with high mortality rates, posing significant threats to public health and wildlife conservation. The viruses have sporadically emerged over the last 40 years at least, and yet the hosts of EBOV in particular remain poorly known and characterized. Here different studies help inform field surveillance through the identification of bat traits that predict filovirus reservoirs and ecological processes that facilitate emergence. **Methods:** Different modeling approaches were used. A mathematical model with seasonal birthing synthesized filovirus and bat data to determine if biannual birthing

might facilitate pathogen persistence. Regression analyses on serological data tested the model predictions. A machine learning approach provided additional information on bats, integrating multiple host trait data. Fragmentation analyses using satellite land cover data and Ebola virus disease outbreak index cases in humans (i.e. spillover from wildlife reservoirs) tested the hypothesis that forest fragmentation was correlated with emergence. **Results:** Synthesis of filovirus and bat data through models suggests bi-annual breeding and longer incubation periods, such as reported for Egyptian fruit bats and EBOV in experimental studies, allow viral persistence in bat colony sizes often found in nature. Serological data and machine learning approaches support the findings, with bats from species with two annual birth pulses more likely to be seropositive (odds ratio 4.4, 95% confidence interval 2.5-8.7) than those with one, suggesting biannual birthing may allow filovirus persistence. Machine learning algorithms suggest species' geographic range overlap may facilitate filovirus persistence. Finally, fragmentation analyses suggest Ebola virus disease outbreaks occurred mostly in hotspots of forest fragmentation. **Discussion:** These analyses suggest surveillance for filoviruses, especially ebolaviruses, might be targeted to young bats from species with biannual birthing in areas of fragmented forested habitat. The link between forest fragmentation and EBOV outbreaks suggests there is common ground between biodiversity conservation and disease risk mitigation. Together these results will help the research community identify where, when and in which species to continue the search for filovirus hosts.

Bats as possible animal origin of MERS-CoV

Susanna K. P. Lau

Department of Microbiology, The University of Hong Kong, Hong Kong, China

Objectives: Bats are important reservoir for emerging viruses including coronaviruses. Although dromedary camels are believed to be the immediate animal source of the recent MERS epidemic, the evolutionary origin of MERS-CoV remains obscure. While horseshoe bats are the primary reservoir of ancestors of SARS-CoV, the possible role of bats in the emergence of MERS-CoV is less clear. When MERS-CoV was first discovered, it was found to be most closely related to *Tylonycteris* bat CoV HKU4 (Ty-BatCoV HKU4) and *Pipistrellus* bat CoV HKU5 (Pi-BatCoV HKU5) previously discovered in lesser bamboo bat (*Tylonycteris pachypus*) and Japanese pipistrelle (*Pipistrellus abramus*) respectively in Hong Kong. Subsequently, two other lineage C betacoronaviruses, BtVs-BetaCoV/SC2013 and Coronavirus Neoromicia/PML-PHE1/RSA/2011 (NeoCoV) were also detected in bats from China and Africa respectively. Interestingly, a lineage C betacoronavirus, Erinaceus CoV VMC/DEU, has also been found in European hedgehogs, which are phylogenetically closely related to bats, in Europe. Although NeoCoV represents the closest bat counterpart of MERS-CoV in most genome regions, the spike (S) protein, important for host receptor binding, is genetically divergent from that of MERS-CoV. On the other hand, Ty-BatCoV HKU4 possessed an S protein being most closely related to MERS-CoV. The spike of Ty-BatCoV HKU4, but not that of Pi-BatCoV HKU5, was able to utilize the MERS-CoV receptor, human dipeptidyl peptidase 4 (hDPP4) or CD26, for cell entry. These findings suggested that bats may be the primary host of the ancestor of MERS-CoV. **Methods**:To better understand the evolutionary path of MERS-CoV, we collected bat samples from various regions in China. **Results**: Diverse CoVs were detected, including a potentially novel lineage C betacoronavirus. Compared to Ty-BatCoV HKU4 and Pi-BatCoV HKU5, the virus was even more closely related to MERS-CoV and NeoCoV in most regions of its genome. In contrast, the S1 region was less closely related MERS-CoV than Ty-BatCoV HKU4 but more closely related to MERS-CoV than Pi-BatCoV HKU5. To determine if this virus can utilize hDPP4 as receptor, binding experiments using S1-receptor-binding domain (RBD), cell entry studies using pseudovirus assays and structural modelling of the RBD-hDPP4 interphase were performed. **Conclusions**: The results suggested a stepwise evolutionary process among lineage C betacoronaviruses in gaining the ability to bind hDPP4, and support a bat origin of MERS-CoV.

Rapid detection of MERS coronavirus ancestors in bats

Prof. Patrick CY Woo, Department of Microbiology, The University of Hong Kong, Hong Kong.

Objectives: Since its first appearance in 2012, the Middle East Respiratory Syndrome (MERS) has affected more than 25 countries in four continents with more than 1,300 cases and a high fatality rate of more than 30%. A novel lineage C betacoronavirus (betaCoV), MERS-CoV, has been confirmed to be the etiological agent. Human dipeptidyl peptidase 4 (hDPP4) was found to be the cellular receptor for MERS-CoV. Subsequent detection of MERS-CoV and its antibodies in dromedaries in various countries in the Middle East and North Africa have implied that these animals are probably the reservoir for MERS-CoV. Other lineage C betaCoVs in bats [e.g. *Tylonycteris* bat CoV HKU4 (Ty-BatCoV-HKU4), *Pipistrellus* bat CoV HKU5 (Pi-BatCoV-HKU5)] and hedgehogs were found to be closely related to MERS-CoV. So far, detection of MERS-CoV and discoveries of its closely related CoVs are most efficiently achieved through RT-PCR. Although RT-PCR is highly sensitive, its turn-around-time is about four hours and the test requires expensive equipment, stringent laboratory set-up and personal attention to prevent laboratory PCR product cross contamination which may lead to false-positive results.

Methods: Recently, we have developed a monoclonal antibody-based rapid nucleocapsid protein (NP) detection assay for on-site diagnosis of MERS-CoV, which can be finished in 30 minutes. **Results and Conclusions**: This rapid test is highly specific for MERS-CoV for human and dromedary samples, as samples containing other human CoVs (HCoV-OC43, HCoV-229E, HCoV-NL63 and HCoV-HKU1) or dromedary CoV UAE-HKU23 all showed negative results. However, we hypothesize that the rapid test can pick up betaCoVs closely related to MERS-CoV; and hence would be useful for the discovery of MERS-CoV ancestors. To test this hypothesis, we examine the usefulness of this rapid test to detect four alphaCoVs and four lineage B, C and D betaCoVs in fecal samples of bats.

Global patterns in coronavirus diversity

One Sutter, Suite 600, San Francisco, CA, 94104 (USA); [7]Wildlife Conservation Society, New York, NY, (USA); [8]= http://www.vetmed.ucdavis.edu/ohi/predict /publications/Authorship.cfm

Objectives: Since the emergence of SARS-CoV and MERS-CoV it has become clear that bats are important reservoirs of coronaviruses (CoVs). Despite this, only 16% of all CoV sequences in Genbank come from bats. The remaining 84% largely consist of known pathogens of public health or agricultural significance, indicating that current research effort is heavily biased towards describing known diseases rather than the 'pre-emergent' CoV diversity circulating in bats. Our study addresses this critical gap, and focuses on the evolutionary and ecological drivers of CoV diversity in resource poor countries, where the risk of zoonotic emergence is believed to be highest. **Methods**: We surveyed the diversity of CoVs in multiple host taxa from 20 countries in Africa, Asia and Latin America to explore the factors driving viral diversity at a 'global' scale. Partial CoV sequences were identified using consensus PCR, which was chosen in part because it could be easily implemented in resource poor settings. Sequences were then parsed into phylogenetic clusters (operational taxonomic units) and analyzed using ecological and epidemiologic approaches. **Results**: In total we identified sequences representing 100 discrete clusters, 91 of which were found in bats, and showed that patterns of CoV diversity correlate with those of bat diversity. This cements bats as the major evolutionary reservoirs and ecological drivers of CoV diversity. Preliminary co-phylogenetic reconciliation analysis indicated that frequent host switching has contributed to CoV evolution, and that regional variation exists in the dynamics of this process. **Conclusions**: Overall our study represents a model for exploring global viral diversity and advances our fundamental understanding of CoV biodiversity and the potential risk factors associated with zoonotic emergence.

SARS coronavirus may have originated from frequent recombination events between SARS-like coronaviruses in a single horseshoe bat habitat

[1] CAS Key Laboratory of Special Pathogens and Biosafety, Center for Emerging Infectious Diseases, Wuhan Institute of Virology, Chinese Academy of Sciences, Wuhan, China; [2]Yunnan Institute of Endemic Diseases Control and Prevention, Dali, China; [3]EcoHealth Alliance, New York City, New York, USA; [4]Programme in Emerging Infectious Diseases, Duke-NUS Medical School, Singapore.

Objectives: Horseshoe bats are recognized as the natural reservoirs of Severe Acute Respiratory Syndrome coronavirus (SARS-CoV), as an increasing number of SARS-like coronaviruses (SL-CoV) have been detected in this bat family since 2005. However, knowledge gaps remain between currently known bat SL-CoVs and the direct progenitor of SARS-CoV. Further information is needed to better understand where and how SARS-CoV originated from bat reservoirs. **Methods:** We have conducted a 5-year surveillance of SL-CoV in a cave inhabited by horseshoe bats in Yunnan, China. Full-length genome sequencing of 11 novel bat SL-CoVs discovered in this single location was performed and genomic characterization, phylogenetic analysis and recombination analysis were conducted. Efficiency of human ACE2 usage was also evaluated in HeLa cells for several newly identified strains. **Results:** Our findings revealed that genetically diverse bat SL-CoVs were circulating in this single location, including different strains with high sequence similarity to SARS-CoV in the highly variable N-terminal

domain (NTD) and receptor-binding domain (RBD) of S protein and the ORF8 region, respectively. Meanwhile, compared with other SL-CoVs, strains identified from this cave exhibited higher sequence similarity to SARS-CoV in the non-structural proteins. Evidence supported that frequent recombination events have occurred within the S gene and around ORF8 between bat SL-CoVs in this cave and may have promoted the generation of the pandemic SARS-CoV. Cell entry studies demonstrated that different newly identified SL-CoVs with variants of S protein are all able to use human ACE2 as the receptor, which represent a potential risk of emergence if given the opportunity to spillover. **Conclusions:** We have identified an epicenter of SL-CoVs where the director progenitor of SARS-CoV likely originated via sequential recombination events. These findings offered important new insight into understanding the geographical and evolution origin of SARS-CoV and highlights the need to pursue the surveillance of bat SL-CoVs to make better preparation for future emergence of SARS-like disease in humans.

A metagenomic approach identifying a MERS-related coronavirus in a bat from South Africa

Marike Geldenhuys[1], Marinda Mortlock[1], Jaqueline Weyer[2], Oliver Bezuidt[3], Ernest Seamark[4], Teresa Kearney[5,6], Cheryl Gleasner [7], Tracey Erkkila[7], Helen Cui[7] and Wanda Markotter[1]

[1]Centre for Viral Zoonosis, Department of Medical Virology, Faculty of Health sciences, University of Pretoria, Pretoria, South Africa; [2]Centre for Emerging, Zoonotic and Parasitic Diseases, National Institute for Communicable Diseases, Sandringham, South Africa; [3]Centre for Microbial Ecology and Genomics, University of Pretoria, Pretoria, South Africa; 4AfricanBats NPC, South Africa and Centre for Wildlife Management, University of Pretoria, Pretoria, South Africa; [5]Animal, Plant and Environmental Sciences, University of the Witwatersrand, Johannesburg, South Africa; [6]Ditsong Museum of Natural History, Pretoria, South Africa; [7]Los Alamos National Laboratory, New Mexico, USA

A Middle East Respiratory Syndrome (MERS) related coronavirus was previously detected in a Cape serotine bat (*Neoromicia capensis*) from the KwaZulu Natal Province in South Africa. Though the virus showed significant similarity to human MERS coronavirus (MERS-CoV), it was too divergent to be considered the direct progenitor of the virus causing human MERS-CoV outbreaks. **Objectives:** As part of a broader viral discovery surveillance program investigating excreted zoonotic viruses from bats, we implemented metagenomic techniques to collectively screen the virome of 60 *Neoromicia* bats constituting 6 species from 4 South African provinces sampled from 2007-2015. **Methods:** Using a viral particle enrichment methodology, total nucleic acids from faecal and rectal specimens were sequenced on Illumina's MiSeq and NextSeq500. Coding complete genome sequencing was performed with further amplicon sequencing on Illumina's MiSeq. Bayesian (BEAST) phylogenetic comparisons and pairwise estimations were performed with full genome representatives of all 4 betacoronavirus lineages. **Results:** We detected a MERS-related betacoronavirus from the same *Neoromicia* species. The virus shared a 97.2% overall nucleotide identity to another *Neoromicia* MERS-related virus identified in South Africa, and 85.5-85.6% nucleotide identity to human and camel (alternative hosts) strains of MERS-CoV. Significant discrepancies between bat-borne and human/camel MERS-CoV genomes were attributed to the low (63.7-64.3%) amino acid similarities of the spike genes, which is responsible for receptor attachment. Genome comparisons between betacoronavirus lineages of emerging viruses, namely MERS-CoV and the equivalent Severe Acute Respiratory Syndrome (SARS) coronaviruses, indicate that the relative phylogenetic distances between *Neoromicia* MERS-related strains and human/camel MERS-CoV are far greater than the distances between SARS-related bat viruses and human SARS viruses. **Conclusions:** Continued surveillance within the *Neoromicia* genus may yield additional MERS-related viruses sharing greater similarity to the human and camel MERS strains (as was shown with detected SARS-related bat viruses). Alternatively, if the progenitor of MERS-CoV originated from the *Neoromicia* genus, the currently identified diversity would suggest that significant receptor adaptation was required within dromedary camels (or unknown intermediate hosts) prior to being transmitted to humans. Continued viral surveillance in regions inhabited by both these hosts may aid in understanding the emergence of MERS.

New insights into the antiviral innate immune response of *Desmodus rotundus*

Sarkis Sarkis, Marie-Claude Lise, Edith Darcissac, Stéphanie Dabo, Christine Neuveut, Benoît de Thoisy, Eliane Meurs, Anne Lavergne and Vincent Lacoste

Institut Pasteur de la Guyane

The common vampire bat, *Desmodus rotundus*, is the main reservoir of rabies virus in South America. Mechanisms that allow persistence of viruses in bats are not well-defined. During the last decade, innate immunity has emerged as one of the implicated mechanisms. As a non-model organism, no tools were available regarding *D. rotundus*, there was therefore a crying need for characterizing their immune system. Given that the interferon (IFN) system provides the first line of defense upon viral recognition, we investigated the IFN-I response in an immortalized cell line, established from a *D. rotundus* embryonic lung, stimulated with synthetic

dsRNA (poly I:C). We observed that stimulation induced high levels of expression of all PRRs involved in dsRNA recognition, as well as a rapid up-regulation of both IFN-α1 and β. Furthermore, in characterizing some of the ISGs such as OAS1, PKR and ADAR, we identified two OAS1 genes, tentatively named *OAS1a* and *OAS1b*. Upon stimulation, *OAS1b* appeared to be the most inducible ISG tested. These results not only provide evidence of the intact signaling pathway of the IFN-I in our cellular model, but also that *OAS1b* may be a major player in antiviral activity in *D. rotundus*. In the frame of the present work, we generated a sum of insightful tools specific of the common vampire bat useable to the study of a number of different viruses, the first of which is the rabies virus.

A comparative study of the autophagy pathway during virus infection of bat (natural) and human (accidental) host cells

Eric D. Laing[1], Spencer L. Sterling[1], Dawn L. Weir[1], Sasha E. Larsen[2], Linfa Wang[3], Brian C. Schaefer[1], and Christopher C. Broder[1]

[1]Department of Microbiology, Uniformed Services University, Bethesda, MD, USA; [2]Department of Pharmacology, Uniformed Services University, Bethesda, MD, USA; [3]Programme in Emerging Infectious Diseases, Duke-NUS Medical School, Singapore

Objectives: In contrast to other terrestrial animals, infection of bats with ebolaviruses and henipaviruses does not cause symptomatic disease. Whether bats have antiviral mechanisms to control these infections or how these viruses persist at a cellular level is largely unknown. Autophagy is a cellular protein homeostatic process, which has been implicated as a cell-autonomous innate defense mechanism against a broad array of intracellular infections. Bats are longer lived compared to other similarly sized mammals and increased proteostatic processes have been observed in long-lived mammalian species. **Methods:** In this study, we performed an investigation of autophagy in cell lines from the black flying fox (*Pteropus alecto*), a natural host of Hendra virus and Australian bat lyssavirus (ABLV), and human cells. ABLV, a neurotropic virus, was used as a model bat-borne virus to examine the interactions between an intracellular virus infection and autophagy in host cells. **Results:** Autophagy activation was observed in *P. alecto* brain tissue-derived primary and secondary cells infected with replication competent ABLV 1 and 2 days post infection. Compared to a human neuroblastoma cell line, *P. alecto* kidney and brain cells exhibited a higher level of basal autophagy. Treatment of bat and human cell lines with pharmacological activators of autophagy reduced ABLV replication. Quantification of ABLV titers and protein levels after infection of bat and human cells lines demonstrated that bat cells were less permissive to ABLV infection. Lentiviral knockdown of autophagy-related gene-5 (ATG-5) in bat and human cell lines did not result in a significant silencing of the autophagy pathway, however, a trending increase of ABLV replication levels was observed in the ATG-5 knockdown cells. Pre- and post-infection treatment of human neuroblastoma cells with BEZ235, an mTOR- and PI3K-inhibitor, significantly decreased virus replication in a dose-dependent manner. **Conclusions:** To our knowledge this is the first study to explore whether the autophagy pathway has a role as an antiviral defense mechanism during virus infection in bats. Ongoing experiments aimed at the interplay between autophagy and apoptosis will be critical to supporting our hypothesis that autophagy is an antiviral defense mechanism in bats.

Development of a minimally invasive individual identification technique for continuous monitoring of African bat species

Stewart McCulloch[1]; Teresa Kearney[2,3,4]; Ernest Seamark[3,5]; Janusz Paweska[6]; and Wanda Markotter[1]
[1] Centre for Viral Zoonoses, Department of Medical Virology, Faculty of Health Sciences, University of Pretoria, South Africa; [2] School of Animal, Plant and Environmental Sciences, University of Witwatersrand, Private Bag 3, Wits 2050, South Africa [3] AfricanBats, 357 Botha Ave, Kloofsig, 0157, Pretoria, South Africa; [4] Ditsong National Museum of Natural History, Pretoria, South Africa; [5] Centre for Wildlife Management, Faculty of Natural and Agricultural Sciences, University of Pretoria, South Africa, 0001; [6] Centre for Emerging, Zoonotic and Parasitic Diseases, National Institute for Communicable Diseases, Sandringham, Johannesburg, South Africa.

Objectives; An ever increasing number of potentially zoonotic diseases are associated with bat populations throughout the world, and as such the continuous monitoring and surveillance of these populations has become essential, not only for disease epidemiology but also in order to address the lack of knowledge available for biology, ecology and life histories of the majority of bat species. This requires the development of an ethically acceptable, cost effective, durable and reliable marking system to facilitate monitoring of individual bats. In order to address annual population structure, potential movement patterns and individuals' infection or exposure status we tested the ability to uniquely mark 11 bat species from six families, ranging in mass from 4g to 120g, using wing tattoos. Specific serological monitoring of Lagos bat virus exposure in *Rousettus aegyptiacus,* focussing on the presence and duration of neutralising antibodies has been undertaken since 2012. **Methods;** Non-toxic black ink was applied into the interdermal layers of the propatagial membrane of the bat by means of a tattoo system with nine-pronged needles. The tattooing procedure was performed on individual bats from a captive colony of *R.*

aegyptiacus (n=287) and free-flying, wild populations of the aforementioned species (n=2559). The robustness and longevity of this system was assessed from recaptures of tattooed individuals representing four of the above species in the wild, and observations of the captive colony of *R. aegyptiacus*. **Results;** This technique provides a simple, durable and cost effective marking system for both immediate and medium term monitoring, with no observed detrimental effects to the individuals to date. The longest periods between application and observation of tattoos has been; 927 days for *R. aegyptiacus*, 292 days for *N. thebaica*, 126 days for *M. natalensis* and 89 days for *Rh. smithersii.* Over 100 *R. aegyptiacus* recapture events have demonstrated individuals' seroconversion, antibody maintenance and loss against LBV. **Conclusion;** This technique has shown potential to facilitate monitoring individual bats' infection or exposure status in both captive and wild settings, with individual seroconversion and titer loss against LBV being observed, as well as providing an effective mark-recapture identification for population and movement studies.

Characterization of a novel Rhabdovirus isolated from insectivorous bat (*Pipistrellus kuhlii*) in Italy
Davide Lelli[1], Alice Prosperi[1], Chiara Chiapponi[1], Paola Debenedictis[2], Anna Maria Gibellini[3], Stefania Leopardi[2], Enrica Sozzi[1], Dino Scaravelli[4], Ana Moreno[1], Antonio Lavazza[1]

[3]Wildlife Rehabilitation Center WWF of Valpredina via Pioda n.1, 24060 Cenate Sopra(BG), Italy
[4]University of Bologna, Department of Veterinary Medical Sciences, via Tolara di sopra 50 - 40064 Ozzano Emilia (BO), Italy

Objectives: *Rhabdoviridae* is one of the most ecologically diverse families of RNA viruses with clinical importance. Herein we report the isolation and the genome characterization of a novel rhabdovirus detected from a bat collected within a survey implemented in Italy on emerging viruses of bats. **Methods:** A fresh carcass of an adult female of *Pipistrellus kuhlii* spontaneously dead in a wildlife rehabilitation center in Northern Italy was fully necropsied. Tissue samples from different organs (lung, hearth, intestine) were subjected to viral isolation on cell culture. Virus identification was performed using negative staining electron microscopy (nsEM) and NGS sequencing. Molecular and phylogenetic analyses were performed. **Results:** Anamnesis reported sensory depression, inappetence, normal body mass and injuries of patagium consistent with a cat bitten. The death occurred three days after the admission to the rehabilitation center and no pathological lesions indicative of infectious diseases were observed at necropsy. CPE was observed on VERO cells inoculated with a pool of organs and nsME performed on cells supernatants revealed characteristic bullet-shaped viral particles referable to rhabdovirus. Tests aimed to exclude rabies and related lyssaviruses resulted negative. The complete genome size was 11,780 nt comprised 5 genes encoding the canonical rhabdovirus structural proteins and an additional transcriptional unit (U1) encoding a small protein (157 aa) located between the G and L genes (3'-N-P-M-G-U1-L-5'). BLAST analysis showed the highest nucleotide identity (65%) to Le Dantec virus (LDV) (human, 1965 Senegal) the prototype strain of the putative genus Ledantevirus. The most highly conserved protein L shared 70% and 69% of aa identity with LDV and Keuraliba virus (KEUV) (gerbil, 1968 Senegal) respectively. Phylogenetic tree based on full-genome sequence confirm the belonging of the new isolate to the ledantevirus group. **Conclusions:** A novel rhabdovirus was identified from *Pipistrellus kuhlii*, the most common species in urban areas in Italy. This finding represents (beside lyssaviruses) the only bat-borne rhabdovirus isolated in Europe. Specific diagnostic tools for viral detection will be set up for epizootiological investigations aimed to define the viral ecology and diffusion in bats population in Italy, in order also to further characterize and clarify its zoonotic potential.

Age-specific dynamics of maternally- and infection- derived immunity within African bat populations
Alison J Peel[1], Kate S Baker[2], David TS Hayman[3], Andrew A Cunningham[4], James LN Wood[5], Romain Garnier[5] and Olivier Restif[5]

[1] Environmental Futures Research Institute, Griffith University, Nathan, QLD, Australia; [2] Institute for Integrative Biology, University of Liverpool, UK; [3] Molecular Epidemiology and Public Health Laboratory, Hopkirk Research Institute, Massey University, Palmerston North, New Zealand; [4] Institute of Zoology, Zoological Society of London, Regent's Park, London, UK; [5] Department of Veterinary Medicine, University of Cambridge, Cambridge, UK

Objectives: Predicting and managing spillover of emerging infectious diseases to domestic animals and humans depend on data on reservoir host distribution, ecology and immunology as well as the mechanisms governing pathogen transmission among its populations. However, such data are generally sparse. This is exemplified by old-world fruit bats, which have been linked to an increasing number of zoonotic viruses, but whose ecology is

challenging to study and immunology has only recently begun to be elucidated. Even where appropriate data are available, fission-fusion population structures make it challenging to separate out the dynamical effect of pathogen reintroduction into the study population through movement from the transmission dynamics expected within a closed population. Island populations provide ideal natural experiments and involve simplifications analogous to the assumptions often made in modelling studies (e.g. single, closed population of a single species), allowing exploration of underlying processes. Here, building on an extensive body of work on straw-coloured fruit bats (*Eidolon helvum*), we aim to further elucidate fundamental processes governing viral dynamics, including the role of maternally-derived antibodies (MatAb). **Methods:** We focus on two viruses for which *E. helvum* is a reservoir (Lagos bat virus (LBV) and African henipavirus) and look for evidence of the presence of MatAb in wild *E. helvum* from continental and island populations. We use rare age-specific data to model waning rates of maternally- and infection- derived antibodies. These results then informed the parameterisation of a stochastic seasonal birth model to explore population-level persistence in the presence of MatAb, in both naive and non-naive populations. **Results:** Statistical modelling supported age as the strongest determinant of seroprevalence for both henipavirus and LBV, in addition to highly significant correlations between mother-offspring pairs. Age-specific seroprevalences predicted rapid loss of maternal immunity and effectively lifelong infection-induced immunity (particularly for LBV). The inclusion of MatAb had considerable implications on viral persistence within populations in a dynamic birth pulse model. **Conclusions:** This study helps to better understand endemic viral dynamics in bat populations, and the implications of considering the presence of MatAb in broader wildlife disease systems.

Detection of rubula- and related viruses in an Egyptian fruit bat (*Rousettus aegyptiacus*) colony in South Africa

Marinda Mortlock[1], Jacqueline Weyer[2], Janusz Paweska[2] and Wanda Markotter[1]

[1]Centre for Viral Zoonoses, Department of Medical Virology, Faculty of Health Science, University of Pretoria, South Africa; [2]Centre for Emerging, Zoonotic and Parasitic Diseases, National Institute for Communicable Diseases, Sandringham, Johannesburg, South Africa

Objectives: More than 22 viral families have been associated with bats globally, eight of which with the Egyptian fruit bat (*Rousettus aegyptiacus*) occurring across sub-Saharan Africa and parts of the Middle East. Among numerous other zoonotic viruses, this species has also been associated with zoonotic henipaviruses (family *Paramyxoviridae*). More recently, a newly described zoonotic rubulavirus, Sosuga virus, was detected in this species from Uganda. The occurrence and diversity of these viruses remain unknown in Southern Africa. **Methods:** A broadly reactive hemi-nested RT-PCR assay targeting the *Avula-Rubulavirus* genera within the *Paramyxoviridae* family was used for nucleic acid detection. Spleen and kidney samples from bats collected during 2012-2016 from a cave in the Limpopo Province of South Africa, were retrospectively screened for the presence of rubulavirus RNA. Virus isolation, next-generation Illumina sequencing and amplicon sequencing were used to obtain full gene or genome sequences for comparison. **Results:** A total number of 137 bats were screened of which 5.84% of spleen samples tested positive. We detected several rubulavirus-related viruses grouping in a sister clade to the *Rubulavirus* genus. This clade contains other bat-associated rubulaviruses including the zoonotic Sosuga virus. Additionally, a co-infection with a virus closely related to human mumps virus was detected in one of the bats sampled. Preliminary results also suggest seasonality of these viruses in the colony, as positive individuals were predominantly detected in winter months. This phenomenon coincides with the loss of maternal antibodies i.e. an influx of susceptible individuals into the colony. **Conclusion:** The first evidence of bat-associated rubulaviruses from *R. aegyptiacus* in South Africa, some of which are related to know human pathogens, are reported. Additionally, a considerable diversity was detected from a small sample size. Enhanced surveillance might shed light on the prevalence of these viruses within the targeted colony. Considering the potential excretion of these viruses during the winter months might be the next step in determining their transmission potential. This is of importance as the specific cave is situated within a rural settlement surrounded by free-roaming livestock and is frequented by humans for religious practices.

Influenza-like virus and paramyxovirus screening in Brazilian bats

Angélica Cristine Campos[1]; Luiz Gustavo Góes[1]; Cristiano Carvalho[2]; Guilherme Ambar[5]; Luciano M. Thomazelli[1]; Jhiovana Cristielly Costa[1]; Mariana Cristine de Souza[1]; Adriana Ruckert[3]; Débora C. Oliveira[3]; Luzia F. Martorelli[3]; Ana Paula Kataoka[3]; Marcelo S. Nardi[4]; Juliana L. Summa[4]; Roberta Marcatti de Azevedo[4]; Wagner A. Pedro[2]; Luzia H. Queiroz[2]; Ariovaldo P. Cruz-Neto[5] and Edison Durigon[1]

[1] Departamento de Microbiologia, Instituto de Ciências Biomédicas (ICB), Universidade de São Paulo (USP), São Paulo-SP; [2] Faculdade de Medicina Veterinária de Araçatuba, Universidade Estadual Paulista (UNESP), Araçatuba- SP; [3] Centro de Controle de Zoonozes (CCZ) do Município de São Paulo-SP; [4] Divisão Técnica de Medicina Veterinária e Manejo da Fauna Silvestre (DEPAVE-3), Secretaria do Verde e Meio Ambiente, Prefeitura

do Município de São Paulo, São Paulo-SP; [5] Departamento de Zoologia, Instituto de Biociências, Universidade Estadual Paulista (UNESP), Rio Claro-SP

Objectives: Bats are recognized as natural reservoirs of emergent viruses related to severe human disease outbreaks including Rabies, Nipah, Hendra and SARS coronavirus. Since the discovery of Hendra and Nipah emergent paramyxovirus in late 1990s in flying foxes bats from Australia and Asia, others bat-borne paramyxovirus have been identified in bats across the globe including bats species from Australia, Asia, Africa and America. Recently, new members of the influenza A virus where detected in bats from Guatemala and Peru, amplifying the host variety of Influenza virus A group. Despite the recent detection of Influenza-A and Paramyxovirus in South American bats and the spill-over events of paramyxovirus from bats to humans only few studies had analyzed the occurrence of influenza-like virus and paramyxovirus in Brazilian's bats. These study aims to analyze the occurrence and diversity of influenza-like virus and paramyxovirus in Brazilian bats. **Methods:** A total of 1071 samples including distinct tissues (intestine, lung, kidney and spleen), rectal and oral swabs, and serum (821 individuals/47 species) from urban area and Atlantic Forest biome were analyzed. The Total Nucleic Acid was extracted and cDNA synthesis was performed. Samples were screened by Pan-Flu PCR assay targeting the Influenza PB1 gene and by a Semi-Nested Pan-paramyxovirinae PCR assay targeting the L gene. **Results:** PCR fragments for both assays were observed in electrophoresis analysis. The amplicons were purified and sequenced by Sanger method. Sequencing confirmed the presence of 3 distinct Paramyxovirus lineages in eight bats. Morbillivirus-like was detected in insectivorous bat's *Molossus rufus* (intestine) and *Myotis nigricans* (lung)*;* Unclassified Paramyxovirus and one possible Henipa-like virus was found in hematophagous bats *Desmodus rotundus* in kidney samples*.* **Conclusions:** This study report the lack of detection of influenza-like in a high number of bat samples and may indicate the absence or the lower prevalence of these virus group in bats from Brazil. Our results also suggest the presence of paramyxovirus genotypes in bats commonly found in rural and urban area, including a probably Henipa-like virus in hematophagous bats, species that already had been described as vectors of rabies and others paramyxovirus with unknown zoonotic potential.

Hendra virus dynamics and spillover

Raina Plowright[1], Maureen Kessler[1], Alison Peel[2], Hamish McCallum[2], Peggy Eby[3]

[1]Department of Microbiology and Immunology, Montana State University; [2]Environmental Futures Research Institute, Griffith University, Queensland, Australia; [3]University of New South Wales, Australia.

Hendra virus provides a model system for understanding the dynamics of emerging bat viruses and spillover. One factor constraining our ability to study Hendra virus spillover is the limited knowledge of the biology of the virus within its reservoir hosts. We present three different hypotheses for how within-host pathogen dynamics in bats may interact with among host factors to drive dynamics of emerging bat virus spillover. These hypotheses include: pulsed viral excretion due to seasonal epidemics, local persistence due to waning immunity within bats, or episodic shedding from persistently infected bats. We discuss the evidence for each hypothesis and show that differentiation among these scenarios is essential for predicting and managing spillover.

Using serology to understand the dynamics of concurrent viral infections in pteropid bats

Jonathan H. Epstein[1], Noam Ross[1], Ariful Islam[1], Dan Crowley[1,2], Gary Crameri[3], Christopher Broder[4], Linfa Wang[5], and Peter Daszak[1].

[1]EcoHealth Alliance, NY USA; [2]Columbia University Mailman School of Public Health, NY USA; [3]CSIRO Australian Animal Health Laboratory, Geelong, VIC, AUS; [4]Uniformed Services University, MD USA; [5]Duke-NUS, Singapore

Objectives: Fruit bats of the genus *Pteropus* are reservoirs for henipaviruses throughout their range. *Pteropus medius* is the natural reservoir for Nipah virus in India and Bangladesh, and mechanisms of spillover to humans primarily involves contamination of date palm sap with excreta. Serological dynamics have provided insight into patterns of Nipah virus infection in this host, but other viruses, including Nipah-like viruses have been identified through pathogen discovery techniques. Little is known about infection patterns of other viruses within this species, or their likelihood of infecting other animals or people. **Methods**: We screened sera from a single population of *P. medius* in Bangladesh collected quarterly over six years for IgG antibodies against henipaviruses (NiV, HeV, CEDV), filoviruses (EBOV, MARV), and Menangle virus, using assays containing virus-specific solubilized glycoproteins or F proteins in a Luminex platform. **Results and Conclusions:** Here we present preliminary observations of comparative temporal patterns for multiple viral agents that suggest co-circulation in this population. We also discuss challenges in interpretation of serology

when studying viral infections in wildlife, particularly when multiple antigenically related viruses may be present.

Estimating viral richness and viral sharing in bats: integrating previously-published and newly-acquired field data

Kevin J. Olival[1], Noam Ross[1], Evan A. Eskew[1], Anna R. Willoughby[1], Carlos Zambrana-Torrelio[1], Peter Daszak[1], and PREDICT Consortium[2]

[1]EcoHealth Alliance, New York, NY 10001, USA; [2]http://www.vetmed.ucdavis.edu/ohi/predict/publications/Authorship.cfm

Objectives: A handful of studies published over the last 8 years have sought to identify the host, ecological, and evolutionary factors that best explain species-level differences in viral richness in bats. Similarly, a few studies have also aimed to answer the golden question: Do bats carry a significantly larger number of total viruses, or a larger number or proportion of zoonotic viruses than other mammals? Our objective is to address these critical questions using statistical models and large datasets collated from the literature and acquired from the field. **Methods:** We collated data from the past 75 years of published for over 2800 mammal-virus associations, representing 754 mammal species and 586 ICTV-named viral species. We fit a series of generalized additive models to these data to identify and examine the functional form of significant predictor variables for total and zoonotic viral richness. Using our best-fit models we also estimate expected viral richness for each host species under a scenario of 'maximum' research effort. We map these viruses in geographic space. We also use species accumulation curves to estimate viral richness from standardized, field-acquired data from the USAID PREDICT project (http://www.healthmap.org/predict/). Network models and statistics were used to compare patterns of viral sharing among bats between the literature and field-acquired datasets. **Results:** For the all mammal analyses: The best-fit model for total viral richness per wild mammal species explained 49.2% of the total deviance, and included a per-species measure of disease-related research effort, phylogenetically corrected body mass, geographic range, mammal sympatry, and taxonomy (order) After controlling for research effort, the proportion of zoonotic viruses per species is predicted by phylogenetic relatedness to humans, host taxonomy and human population within a species range—which may reflect human–wildlife contact. We demonstrate that bats harbor a significantly higher proportion of zoonotic viruses than all other mammalian orders. For the bat field-acquired data we show significant differences in viral richness estimates across bat genera and viral family, as well as differences in the rates of saturation. Clustering in bat host-virus networks follow some predictable patterns and identify additional bat species to target for viruses of interest. **Conclusions:** These host-specific analyses and estimates of viral richness, including the unobserved or 'missing' viruses, allow us to better identify and target which species and regions should be preferentially targeted to characterize the global bat virome.

Optimised sampling efforts and screening assays identify several MERS-related coronaviruses in South African bats

Wolfgang Preiser[1,2], Ndapewa L. Ithete[1], Nadine Cronjé[1], Tasnim Suliman[1]

[1] Division of Medical Virology, Faculty of Medicine & Health Sciences, University of Stellenbosch, South Africa; [2] National Health Laboratory Service (NHLS) Tygerberg, Cape Town, South Africa

Objectives: Bats are considered reservoir hosts for all mammalian alpha- and beta-coronaviruses (α-, β-CoV). Following the emergence of SARS in 2002/03 and the subsequent identification of *Rhinolophus sinicus* as the likely ancestral SARS-CoV source, a wide diversity of bat CoV has been described worldwide. We work in transdisciplinary collaborations with ecologists and zoologists to define CoV diversity and ecology in South African bats. In addition to general "opportunistic" surveillance, species-specific studies of *Neoromicia capensis* and *Rhinolophus spp* are conducted, including longitudinal studies of bat colonies to determine shedding patterns and diversity of viruses present. **Methods:** Since 2011, 24 different bat species have been sampled along rainfall and altitudinal gradients across different biomes; namely Fynbos, Forest, Nama Karoo, Grassland, and Savanna. Sample types include faecal pellets, saliva and urine swabs, and when voucher specimens are sacrificed for museum collections, also blood and organs. Sequences of the 816bp RGU fragment (Drexler et al., 2010) for species classification were used to construct ML trees in MEGA v7. **Results:** An improved screening method greatly increased the CoV detection rate. Of 686 samples tested, 92 from 9 bat species were screening-positive: 66 for α-CoV, 19 for β-CoV, and 7 for both. The majority of sequences identified are α-CoVs, with ~20% prevalence for *N. capensis*. Preliminary analyses of partial RdRp, nucleocapsid and spike gene fragments of novel β-CoV identified in Neoromicia and Pipistrellus bats are closely related to BtCoV PML-PHE1/RSA/2011 (NeoCoV), previously found by us in a *N. capensis* and belonging to the same viral species as the recently emerged MERS-CoV, responsible for the ongoing

outbreak in the Arabian Peninsula. **Conclusions:** Extensive, dedicated sampling efforts allowed detection of α- and β-CoV from a wide range of bat species across large parts and different biomes of South Africa. An improved screening PCR approach yielded significantly more positive samples. There is substantial CoV diversity in southern African bats, including, most importantly, additional MERS-CoV-related CoV, which will hopefully help to address the unresolved question of the origin of this zoonotic pathogen.

Coronavirus diversity in bats from urban, rural and forest areas of Atlantic and Amazon Forest biomes, Brazil.

Objectives: Epidemiological and phylogenetic studies indicate that four out of six coronavirus capable of infecting humans are the result of spill over events of virus from bats to humans. Despite the great diversity of coronaviruses in bats, the large number of bat species in Brazil (15% of the world's bat diversity) and the presence regions classified as hotspot for zoonotic pathogen emergence only few studies have analyzed the circulation of coronaviruses in Brazilian's bats. This study aims to evaluate the diversity of CoV circulating in bats in Brazil, covering different species, habitats, and life history of the hosts. **Methods:** We analyzed 840 bats from 53 species and five bat families with a pancoronavirus detection assay. Intestine, lungs, serum and rectal/oral swabs were obtained from bats from forest, urban, and rural areas located in the Atlantic and Amazon Forest biomes. **Results:** Distinct coronavirus lineages were detected in in bats from all sites screened. The coronavirus RNA was detected in 27 individuals from eleven bat species including *Artibeus lituratus(4), Carollia perspicillata (5), Eumops glaucinus(1), Glossophaga soricina (3), Mimon crenulatum(1), Molossus rufus(2), Molossus molossus (1), Myotis nigricans(1), Myotis riparus (1), Phyllostomus discolor(1)* and *Sturnira lilium (7)*. The analysis of coronavirus phylogenetic relation from nucleotide sequences obtained showed the circulation of the 25 Alphacoronavirus genotypes (α-CoV) and two Betacoronavírus (β-CoV), distributed in thirteen lineages (eleven α-CoV and two β-CoV). Results indicate the presence of a great coronavirus diversity in bats from Brazil including potential new and already described lineages. We describe the detection of a bat coronavirus genetically related with Alphacoronavirus-1 species, which are a group of closely related viruses with an evolutionary history of recombination and cross-species transmission between domestic and livestock animals. We also report the circulation of Betacoronavirus lineage "C", related to emergent highly pathogenic coronavirus CoV-MERS, in South American bats commonly found in urban areas, representing the first detection of coronavirus Clade C in this subcontinent. **Conclusions:** Our report points to the great diversity of CoV genotypes in New World bats, more specifically in the Atlantic Forest Biome, providing a better understanding of CoV diversity, host range and biogeographic distribution.

Preliminary Evidence of a Novel Alphacoronavirus and Secondary Acquisition of Tymoviridae and Partitiviridae in Little Brown Bats (*Myotis lucifugus*) in Southcentral Alaska.

Douglas Causey[1], Jonathan C. Rupp*[1], Maegan Lange[1], Megan Howard[2], Anitha Sundarajan[3], Jonny Sena[3], Faye D. Schilkey[3], Molly Murphy[4], Sarah Cooperman[1], Eric Bortz[1]

[1]Dept. of Biological Sciences, University of Alaska Anchorage; [2]Battelle Memorial Institute; [3]National Center for Genome Resources, Santa Fe NM; [4]Dept. of Veterinary Medicine, University of Alaska Fairbanks
*Presenter

Objective: We sought to analyze the virome of the most common bat species in Alaska, *Myotis lucifugus*, the little brown bat. Swabs, tissue, and fecal samples were collected from habitats in close proximity to barns, farm buildings, and human habitations in southcentral Alaska. **Methods**: Total RNA extracts were screened by RT-PCR and CoV ORF1a, and primary RNA samples were used in library preparation for short-read, paired-end next generation sequencing on an Illumina HiSeq platform. **Results**: Sanger sequencing of amplicons confirmed the presence of an alpha-coronavirus phylogenetically related to

persistent alphacoronaviruses detected in bats in Colorado and the Rocky Mountains. Aligning to a reference *M. lucifigus* virus from Colorado, bat alphacoronavirus CDPHE15/USA/2006, we assembled a full-length genome (28,515nt) identifying the novel alphacoronavirus/bat/Alaska/s7/2014. A high degree of thermodynamically stable stem-loop RNA structures are predicted by Mfold within 700nt of 5' and 3' termini of genome**.** While nucleotide conservation to the Colorado virus was 96%, notable amino acid differences were identified in coronavirus proteins. In two distinct bat samples, preliminary results indicate the likely presence of tymovirus (eg. Dulcama mottle virus) probably acquired through ingestion of insects feeding on infected plants. In addition, initial results indicate presence of alpha-partitivirus closely aligned to *Rosellina*-type associated with spruce/alder and other partitivirus-like sequences. Secondary acquisition of virus obtained by feeding or incidental infection by fungi (eg. gamma-partitivirus associated with *P. destructans*) has been previously described for bats collected from similar ecological settings (eg. Thapa et al. 2016). **Conclusions**: We continue to further refine these initial for better resolution of the virome of Alaska bats.

Are big brown bat cells different than human cells in their innate immune response to coronavirus and viral ligands?

Arinjay Banerjee[1], Robert Brownlie[3], Noreen Rapin[1], Trent Bollinger[2], Darryl Falzarano[1,3] and Vikram Misra[1]

Objectives: Bats are hosts for viruses such as those that closely resemble coronaviruses (CoV) that cause severe acute respiratory syndrome (SARS), Middle East respiratory syndrome (MERS) and porcine epidemic diarrhoea (PED). Despite the serious nature of these diseases in other mammalian hosts, bats naturally infected with CoV or experimentally infected with MERS-CoV do not demonstrate clinical signs of disease. We challenged big brown bat (*Eptesicus fuscus*) cells and human cells with MERS-CoV or viral ligands to study the differences in their interferon and inflammatory responses. **Methods:** *E. fuscus* kidney cell line and bone marrow derived cells, human fibroblast and epithelial cells were challenged with either MERS-CoV or poly(I:C), a double stranded RNA surrogate. Transcripts for several innate immune response genes were quantified using qRT-PCR. Interaction between the bat TNF promoter and a potential repressor of the promoter, c-Rel, was detected by chromatin co-immunoprecipitation and bat c-Rel, TLR3, RIGI and MDA5 transcripts were knocked-down using specific siRNA. **Results:** Both human and bat cells, when stimulated with poly(I:C), contained higher levels of transcripts for interferon beta than unstimulated cells. In contrast, only human cells expressed robust amount of RNA for TNFα, a cell signaling protein involved in systemic inflammation. We further observed that poly(I:C) signaled primarily through TLR3 in big brown bat cells. We examined the bat TNFα promoter and found a potential repressor (c-Rel) binding motif. We demonstrated that c-Rel binds to the putative c-Rel motif in the promoter and knocking down c-Rel transcripts significantly increased basal levels of TNFα transcripts. Both human and bat cells support replication of MERS-CoV to comparable levels. **Conclusions:** We have identified a novel transcription repressor, c-Rel, that inhibits an increase in TNFα transcripts in bat cells after poly(I:C) stimulation. We have also showed for the first time that poly(I:C) signals through TLR3 in bat cells. We are currently studying the modulation of the innate immune response in bat cells by MERS-CoV and individual MERS-CoV and bat coronavirus proteins. Identifying adaptations in the bat innate immune response might allow us to extrapolate the knowledge in identifying potential drug targets in spill-over species, such as humans.

Reverse genetic analysis of bat influenza viruses: A journey full of surprises.

Martin Schwemmle, Institute of Virology, University of Freiburg Medical Center

Our understanding of conventional influenza A viruses was recently challenged by the identification of two novel genome sequences of influenza A-like viruses from bat specimens by next-generation sequencing. Serological surveys indicate that these viruses circulate in various bat species in Central and South America. However, no viable viruses could be isolated from bats, impeding further characterization of these viruses. Interestingly, analysis of the viral surface proteins revealed that the entry machinery of these viruses differ significantly from all known conventional influenza A viruses and may only support entry into bat cells. This talk will summarize recent progress obtained by reverse genetic analysis of bat influenza A-like viruses, including the observation that the host tropisms of these viruses might be larger than anticipated.

Towards understanding bat influenza A-like viruses

[1]Department of Diagnostic Medicine/Pathobiology, College of Veterinary Medicine, Kansas State University, Manhattan, Kansas, United States of America.

[2]Virology, J. Craig Venter Institute, Rockville, Maryland, United States of America.

Objectives: Bats harbor many viruses, which are periodically transmitted to humans resulting in outbreaks of disease (e.g., Ebola, SARS-CoV). Recently, bat influenza A-like virus HL17NL10 and HL18NL11 sequences were identified; however, no viruses were isolated from bats. This discovery aroused great interest in understanding the evolutionary history and pandemic potential of bat-influenza virus. **Methods**: Using synthetic genomics, we rescued a modified bat-influenza virus that had the HA and NA coding regions replaced with those of A/PR/8/1934 (H1N1). **Results**: This modified bat-influenza virus replicated efficiently in vitro and in mice, resulting in severe disease. The results indicate that internal genes of bat influenza A-like viruses are functional to support virial genome transcription and virus replication. Mini-genome replication studies and virus reassortment experiments demonstrated that bat influenza A-like virus has very limited genetic and protein compatibility with Type A or Type B influenza viruses, yet it readily reassorts with another divergent bat influenza A-like virus. **Conclusions**: In conclusion, our data indicate that the bat influenza A-like viruses recently identified are authentic viruses that pose little, if any, pandemic threat to humans; however, they provide new insights into the evolution and basic biology of influenza viruses.

Experimental Infection of Jamaican Fruit Bats (*Artibeus jamaicensis*) with a Rescued Bat HL18NL11 Influenza A-like Virus

Tony Schountz[1], Ashley Malmlov[1], Jingjiao Ma[2], Jinhwa Lee[2], Corey Campbell[1], Tawfik Aboellail[1], Ann Hawkinson[3] and Wenjun Ma[2]

[1]Department of Microbiology, Immunology and Pathology, College of Veterinary Medicine and Biomedical Sciences, Colorado State University; [2]Department of Diagnostic Medicine and Pathobiology, College of Veterinary Medicine, Kansas State University; [3]School of Biological Sciences, University of Northern Colorado

Objectives: Nucleotide sequences of two novel influenza A-like viruses, HL17NL10 and HL18NL11, were recently discovered in New World little yellow shouldered fruit bats (*Sturnira lilium*) and flat-faced fruit bats (*Artibeus planirostris*), respectively. Serological studies indicated high prevalence to these viruses among many species of Phyllostomidae leaf-nosed fruit bats of Central and South America, including Jamaican fruit bats (*Artibeus jamaicensis*). **Methods**: Infectious viruses have not been isolated from bats, therefore an infectious clone of HL18NL11 was generated by reverse genetics technologies that produced particles resembling influenza viruses from transfected cells by electron microscopy. Susceptibility of Jamaican fruit bats to rescued HL18NL11 bat influenza A-like virus was determined during a 28-day challenge experiment via intranasal inoculation. **Results**: The bats exhibited no overt clinical signs of disease nor fever. However, rectal swabs had up to 10^4 $TCID_{50}$ equivalents of HL18NL11 vRNA by real-time PCR in each bat on days 2, 4 and 7 post inoculation, but not day 15 or 28, and in the lungs of one of the bats on day 28 when they were euthanized. Serology showed moderate antibody titers to nucleoprotein by ELISA. Histopathology revealed mild pathology, particularly in the one bat with detectable vRNA in its lung. This bat's lungs showed multifocal mild-to-moderate histiocytic and lymphoplamacytic interstitial pneumonia. Pleocellular infiltrates were especially prominent around adventitia of pulmonary arterioles. Immunohistochemistry with mouse antibody to recombinant H18N11 nucleoprotein revealed virus antigen in the lungs of this bat. **Conclusions**: This is the first study to demonstrate susceptibility to bat influenza viruses and suggests that viral persistence up to 28 days may occur in some bats, supporting the hypothesis that Jamaican fruit bats may be a natural reservoir host of the HL18NL11 virus.

Seroprevalence of alphaviruses, flaviviruses and Rift Valley fever virus in Ugandan bats

Kading RC[1,2], Kityo R[3], Mossel E[1], Borland E[1], Nakayiki T[4], Nalikka B[3], Nyakarahuka L[4], Ledermann J[1], Panella N[1], Gilbert A[5,6], Crabtree M[1], Kerbis Peterhans J[7], Towner J[8], Amman B[8], Sealy T[8], Nichol S[8], Powers A[1], Lutwama J[4], Miller B[1]

[8]Centers for Disease Control and Prevention, Division of High Consequence Pathogens, Viral Special Pathogens Branch

Objectives: Arboviruses including Rift Valley fever virus (RVFV), chikungunya virus (CHIKV) and Sindbis viruses have previously been isolated from naturally-infected East African bats, however the role of bats in arbovirus transmission cycles is poorly understood. The aim of this study was to investigate the exposure history of Ugandan bats to a panel of arboviruses. **Methods**: Insectivorous and fruit bats were captured from multiple locations throughout Uganda between 2009 – 2013. All bat captures were conducted under the approval of IACUC protocols 1731AMMULX (Maramagambo samples) and 010-015 (all other samples). Bats were captured using harp traps or mist nets, taking appropriate biosafety precautions. All serum samples were frozen at -80°C until they were tested for neutralizing antibodies against West Nile virus (WNV), yellow fever virus (YFV), Dengue 2 virus (DENV-2), Zika virus (ZIKAV), CHIKV, o'nyong-nyong virus (ONNV), Babanki virus (BABV), and RVFV by plaque reduction neutralization test (PRNT). **Results**: Sera from up to 626 bats were screened for neutralizing antibodies against each virus. Key findings include the presence of antibodies against ONNV in approximately 15% (44/303) of Egyptian rousette bats (*Rousettus aegyptiacus*) from Maramagambo forest in western Uganda, and antibodies against RVFV in Ethiopian epauletted fruit bats (*Epomophorus labiatus*) captured from Kawuku (5/52) and Egyptian rousette bats from Kasokero cave (3/54). **Conclusions**: Antibodies reactive to flaviviruses were widespread across bat taxa and sampling locations.The data presented demonstrate the widespread exposure of bats in Uganda to arboviruses, and highlight particular virus-bat associations that warrant further investigation.

Presence of zoonotic bat pathogens correlate with reproductive seasons in South African bat populations
Wanda Markotter[1], Muriel Dietrich[1], Teresa Kearney[2,3], Stewart McCulloch[1], Marinda Mortlock[1], Ernest Seamark[4,5] and Janusz Paweska[6]

[1] Centre for Viral Zoonoses, Department of Medical Virology, Faculty of Health Sciences, University of Pretoria, South Africa; [2] Ditsong National Museum of Natural History, Pretoria, South Africa.; [3] Plant and Environmental Sciences, University of the Witwatersrand, Johannesburg, South Africa; [4] AfricanBats, Kloofsig, South Africa. [5] Centre for Wildlife Management, Faculty of Natural and Agricultural Sciences, University of Pretoria, Pretoria, South Africa; [6] Centre for Emerging, Zoonotic and Parasitic Diseases, National Institute for Communicable Diseases, Sandringham, South Africa.

In 2003 we initiated passive surveillance on bats in South Africa with the initial objective to identify rabies–related lyssaviruses, but this has since expanded to include several other possible zoonotic viral and bacterial pathogens. The project has identified viruses in the following families; *Rhabdo, Paramyxo, Bunya, Filo*, *Adeno-, Herpes-, Picorna, Orthomyxo, Circo, Parvo, Papilloma* and *Coronaviridae* as well as the following bacterial pathogens; *Leptospira*, *Rickettsia and Bartonella.* **Objectives:** To determine longitudinal circulation of pathogens we initiated seasonal sampling from 2012 in two cave systems in South Africa. This sampling specifically focused on the reproductive seasons of *Rousettus aegyptiacus* and *Miniopterus natalensis*. **Methods:** Serum was analysed for rabies related lyssavirus, Lagos bat virus, antibodies using a virus neutralization assays. Tissue, urine saliva and fecal samples were tested for the presence of viral nucleic acids using RT-PCR/PCR specific for several viral families. Illumina MiSeq 16S rRNA gene sequencing on low-biomass individual bat samples was used to identify bacterial pathogens. **Results:** Longitudinal studies, specifically focused on measuring the presence of LBV antibodies in *Rousettus aegyptiacus*, indicated cyclic fluctuation of antibodies with a marked increase shortly after the parturition period, which identified this as a high risk period for spill-over. We showed that seasonal bat reproduction is a major driver shaping temporal variations in microbial community structure. A strong temporal shift in oral, fecal and urinary microbiota was also associated with bat reproduction, with significant associations between the microbiota and the sex, or reproductive status. **Conclusion**: This cumulative evidence can be used to indicate periods of increased viral and bacterial circulation, which can be used to make public and veterinary health decisions on spill-over risks.

Body mass index of the Egyptian fruit bat, *Rousettus aegyptiacus*: An indicator of infection status
Low J. de Vries, [1], Stewart McCulloch[1], Janusz Paweska[2] and Wanda Markotter[1]

[1] Centre for Viral Zoonoses, Department of Medical Virology, Faculty for Health Science, University of Pretoria, South Africa; [2] Center for Emerging, Zoonotic and Parasitic Diseases, National Institute for Communicable Diseases, Sandringham, Johannesburg, South Africa

Body mass in conjunction with forearm length has long been used to determine body mass indices for bats. These indices have been further linked to diseases detected in bats, with a low body mass index being a potential indicator of infected bats. **Objectives**: We correlated body measurements to body mass, enabling us to determine

the best measurement that could be used to build body mass indices which can be correlated to disease status of *Rousettus aegyptiacus.* **Methods**: This study focuses on the Egyptian fruit bat (*Rousettus aegyptiacus*) in the Limpopo Province of South Africa. Data was gathered over a two year period, 2015 and 2016, and consisted of measurements of various body parts. **Results**: Wilcoxon Matched pair tests indicated a significant difference in body weight between the two sampling years (V = 34476, p = 0.002466). A strong correlation was found between body mass and forearm length when both years are considered (S = 17252000, p-value < 2.2e-16), as well as for the first (S = 3487900, p-value < 2.2e-16) and second year (S = 1250500, p-value < 2.2e-16) of the study with a strong correlation value; R > 0.78 in all cases. The correlation between mass and forearm length was significant for both males and females during both years (p-value < 2.2e-16), but the correlation value was always lower for females. Other body measurements correlated significantly with body mass, but only forearm length showed a strong correlation. **Discussion**: Forearm length is thus an indicator of body mass in Egyptian fruit bats, as has been found for insectivorous bats. As such, body mass in conjunction with forearm length could be used to build body mass indices, which could be used as a preliminary indicator of disease status for *Rousettus aegyptiacus.*

Environmental constraints drive the viral diversity of two sympatric Amazonian bat species
Arielle Salmier, Sourakhata Tirera, Benoit de Thoisy, Alain Franc, Edith Darcissac, Damien Donato, Christiane Bouchier, Vincent Lacoste and Anne Lavergne

Institut Pasteur de la Guyane

Amazonia is a major biodiversity hotspot which encompasses a great diversity of bat species, as well as a wide variety of climates and vegetation formations. Landscape characteristics (*e.g*. climate, vegetation structure, anthropogenic disturbances) are relevant predictors of species richness and influence the host-pathogens relationships. However, the effects of contrasting environmental conditions on the viral diversity harbored by Amazonian bats have yet to be investigated. Through a metagenomic approach we characterized the viral diversity of two sympatric Amazonian bat species: the common vampire bat, *Desmodus rotundus* (*Phyllostomidae*) and the insectivorous bat, *Molossus molossus* (*Molossidae*). Then, through a statistical approach, we assessed the impact of the landscape characteristics by comparing the viral richness harbored by different populations of vampires and insectivorous bats inhabiting different environments (*e.g.*, forests, edge habitats, anthropized and urban areas). We identified 10,983 viral sequences related to 48 viral families known to infect a wide range of hosts (*i.e.*, bacteria, plants, insects and vertebrates). Most viruses detected reflect the dietary habits, especially within the insectivorous bat species which presented the highest diversity of plant and insect-related viral families. Diversity tests and phylogenetic relationships reconstructed for several mammal-related viral families (*e.g.*, *Bunyaviridae*, *Circoviridae*, *Foamyviridae*, *Herpesviridae*, *Papillomaviridae*) revealed a preferential transmission route within phyla of bats, as well as a potential association of viral diversity with the host's gut microbiota. Three structuring poles related to species traits and environments were identified, explaining the distribution of viral diversity and showed a strong correlation between the type of environment, host phylogeny, diet and viral diversity. The substantial viral richness detected in forest environments is likely due to a wider diversity of prey and favored by more frequent contacts between hosts and overlapping habitats. These findings provide significant insight into viral bat diversity in Amazonia and emphasize that environmental constraints and host features are the main drivers of viral diversity in bat species.

Seasonal and individual predictors of grey-headed flying fox (*Pteropus poliocephalus*) foraging movements in Adelaide, South Australia
Cecilia A. Sánchez[1,2], Terry B. Reardon[3], Wayne S.J. Boardman[4] and Sonia Altizer[1,2]

[1]Odum School of Ecology, University of Georgia, Athens, GA, USA; [2]Center for the Ecology of Infectious Diseases, University of Georgia, Athens, GA, USA; [3]South Australian Museum, Adelaide, South Australia, Australia; [4]University of Adelaide, Adelaide, South Australia, Australia

Objectives: The distribution of flying foxes in Australia is influenced by the unpredictable availability of their preferred diet, especially eucalypt blossoms. Recently, human activities, including destruction of native habitat and planting of non-native vegetation that provides predictable foraging, have altered the distribution and movements of flying foxes. The consequences of this change are important for both bat and human health, given that bats are reservoirs of Australian bat lyssavirus and Hendra virus, both of which cause fatal disease in humans. In 2010, grey-headed flying foxes (*Pteropus poliocephalus)* established a permanent roost in Adelaide, South Australia, several hundred kilometers outside their previous range. Despite incurring juvenile mortality due to extreme heat events, the population now numbers approximately 7000 and is expected to continue growing. **Methods:** As part of a larger study to characterize the health and behavior of the Adelaide flying fox population, we deployed lightweight GPS loggers on bats to track their foraging movements. Loggers recorded a bat's position every 30 seconds when flying and every 45 minutes when stationary, and also recorded acceleration,

speed, and altitude data. Forty foraging sites were ground-truthed to identify feeding resources. **Results:** Five flying foxes were tracked in winter 2016 and 9 in summer 2017, resulting in 112 nights of movement data. Bats exhibited individual variation in movement patterns, with some foraging repetitively, and others ranging more widely over the landscape. The nightly distance traveled depended on the interaction between sex and the ratio of weight to forearm length, but not on season. In the summer, bats foraged predominantly on urban resources, with figs and eucalypts being especially popular. **Conclusions:** This work provides insight into a recently-established, understudied bat population and is useful both to local Adelaide stakeholders as well as other urban citizens seeking to manage the bats that share their space. Foraging on urban resources, especially in residential yards, could increase the chances for disease transmission from flying foxes to humans and pets. Individual predictors of movement should be considered when building models of bat movement and disease risk.

Uganda Bat calls library-developing a tool to survey arthropod-borne viruses associated with Chiroptera
Kityo Robert Martin[1], Kading Rebekah[2], Nalikka Betty[1], Lutwama Julius[3]
[1]Makerere University, College of Natural Science – Department of Zoology, Entomology and Fisheries Science Kampala Uganda; [2]Colorado State University; [3]Uganda Virus research institute

Objectives: We continue to conduct studies of bats in different parts and habitats of Uganda with a number of particular goals: -

i. To continue to understand the occurrence and ecology of bats that may be reservoirs and/or vectors of viruses in Uganda (BM presentation),
ii. To develop a micro-chiroptera calls Library for the country
iii. Continue the development a fast approach that can be used to quickly survey and identify the bat fauna of different parts of Uganda.
iv. To investigate the roles of different species of bats in the ecology of viruses (RK presentation),

Methods: Through a DTRA supported project we particularly targeted to understand bat ecology and their potential roles in virus ecology. This was done through graduate training and research, training in field techniques of capture and processing of bats for detection of and characterization of viruses a pillar institutional players and a compilation of reference calls of micro-chiropteran bats for Uganda. Field biosurveillance training was held with participants from NADDEC, UVRI and Makerere University at Zika forest. A graduate student now preparing his dissertation, was recruited and completed an ecological study on bats in the Kaptum cave. Insect bats are captured using Mist nets, Herp traps and Hand net capture at roost sites. Bats are either free flown, ziplined or light tagged and hand released from which voucher calls are collected. Collected calls are processed using Kaleidoscope Pro version 31.7 for large files that need to be split for examination and processing in Sonobat4.0.6p. **Results**: Cumulatively, voucher calls for 50 species of micro chiropteran bats (over 50% of the Ugandan species) have been collected. Several of these are represented by multiple bats that way taking care of potential intra specific variations, potential ecological variations each of which could affect the call produced by the species. This presentation specifically shares our findings on call characteristics for a sample of the species and highlights the great overlap in signatures for species of Molosid bats, species of the Genus *Scotophilus*, while showing very nicely segregated call signals for Hipposiderid, Rhinolophid and a good number of verspertilionid bats. **Conclusions**: Our next steps are to attempt to collect voucher calls from species we haven't, collect additional calls from species already recorded but from few individuals, and to work with partners to develop a tool that could be used to rapidly identify calls collected from bat detection surveys from different parts of the country.

Dampening of STING-dependent IFN production: an implication of virus tolerance in bats?
Jiazhen Xie[1], Chenxi Ma [1], Yang Li[1], Jie Cui[1], Linfa Wang [2], Zhengli Shi [1] and Peng Zhou[1*]

[1]Wuhan Institute of Virology, Chinese Academy of Sciences, Wuhan 430071, China; [2]Emerging Infectious programme, Singapore Duke-NUD Medical School, Singapore 169857, Singapore

Objectives: Bats are known to harbour a number of zoonotic viruses, many of which are highly pathogenic in human but result in no clinical symptoms in bats. The mechanism of how bats coexist with viruses is still largely unknown. We previously reported the contraction of type I IFN locus and unusual constitutively expression of IFNA in bats. We hypothesis this may help bat to inhibit virus replication. However, as immune response can also do harm to the host, then how bats tolerate viruses and viral induced immune responses become a question. **Methods:** To address this question, we scanned a list of DNA and RNA sensors in bats. We then focus on STING, which played a key role in multiple DNA sensing pathways, for understanding how bats tolerate DNA viruses. We also tested the functionality of bat STING in a list bat immune or non-immune cells. **Results and Conclusions:** We found some of the viral DNA sensors are under faster evolution, implying a change of function. Further experimental data also confirmed the dampening of viral DNA sensing, more specifically STING- dependent IFN production pathway. We then identified a ubiquitous key point mutation in all bat species tested, which hugely

decreased the cGAS-STING sensing ability (80%) by gain-of-function studies. Lastly, we restored the functionality of STING and STING-dependent viral DNA sensing pathway by changing this site to human. We conclude that bat naturally own a dampened STING-dependent IFN production, probably to avoid over responses to virus. This observation provides a model of how bats tolerance thus long-term hosting these viruses.

Regulation of immune activation and dampened inflammation in Pteropid bats
Aaron T. Irving[1], Katarina Luko[1], Matae Ahn[1], Kong Pui San[1], & Lin-Fa Wang[1]

[1]Duke-NUS Medical School, Singapore

Objective: Natural reservoir hosts can maintain low-level infection of pathogens without succumbing to severe disease. Several bat species host viruses such as Ebola, SARS, Nipah, Hendra, and other pathogenic viruses and while these same infections cause mass-inflammation in humans and other animals they are mostly asymptomatic in the bat. As such, bats are a unique model for studying the host control of systemic inflammation. **Methods:** We utilised bat cell lines, primary cells and tissue with qPCR, Western Blot, FACS analysis, NGS transcriptomics and cellular proteomics to profile pathways and characterise signalling mechanisms. **Results:** Through studying immune activation to flaviviruses, influenza and reovirus, along with natural stimulants of innate immunity such as TLR and RLR ligands we are beginning to characterize key differences to their human counterparts for PRRs.. There appears to be differences also in the kinetics and activation signals required for Interferon activation also. In addition, our data, from investigation of primary bat immune cells and studying bat homologs, suggests that inflammasome activation pathways may be altered with dampened activation of downstream inflammation. **Conclusion:** Along with fundamental differences to cell biology, this may indicate an evolutionary adaptation that while supporting flight, may cause susceptibility to infection yet maintain a symbiotic state with several pathogens. Initial observations show several key mutations, altered kinetics and a decrease in sensitivity to induce signaling all appear to be involved. From this we can gain understanding into a mechanism for controlling excess inflammation in humans.

Delineating the phenotype and function of the B cell population in the fruit-eating bat, Pteropus Alecto.
Periasamy P.[1,2], Martínez Gómez J.M.[1,2], Wang LF[3] , and Alonso S.[1,2]
[1]Department of Microbiology and Immunology, [2]Immunology Programme, Yong Loo Lin School of Medicine, Life Sciences Institute, National University of Singapore, Singapore. [3]DUKE-NUS, Singapore.

Objective: The unique ability of bats to act as reservoir for viruses that are highly pathogenic to humans suggests unique properties and functional characteristics of their immune system. However, the lack of bat specific reagents, in particular antibodies, has limited our knowledge of bat's immunity.
Methods: Here, using cross-reactive antibodies, we report the phenotypic and functional characterization of B cells based on anti-mouse I-Ab (MHC-II) and anti-bat IgG. **Results**: Using flow cytometry, we show their distribution amongst the major lymphoid organs and scanned electron micrographs of these sorted population reveal that they are morphologically similar to human and murine B cells. In addition, a large population of these cells test positive for CD19 mRNA, tested using SmartFlare RNA probes, and anti-human CD19 antibody. Uniquely, these cells are able to show an increase in calcium uptake upon cross-linking of their B cell receptor with the addition of secondary donkey anti-goat antibody, which is specific for the goat anti-bat IgG. We also demonstrate T cells and myeloid cells do not release calcium in the presence of IgG and secondary antibody. Furthermore, we also demonstrate that injecting LPS for 5 hrs show an increase in MHC-II$^+$IgG$^+$ B cell population in the spleen and blood. This demonstrates a T-independent B cell activation amongst the B cell population. In addition, this population of cells do not respond to Poly (I:C) stimulation. We also performed single cell RNA sequencing on sorted MHC-II$^+$IgG$^+$CD19$^+$ positive cells to identify various B cell subsets based on their gene signature. Initial analysis reveal that these cells show increased expression of CD19 and do not express CD3, CD8 and CD11b. **Conclusions**: Here, we demonstrate for the first time the phenotype and function of B cells in *Pteropus Alecto.* This provides us with a platform to isolate and further elucidate the role of these cells in infectious models.

Integrative measures for assessing "health" in free-ranging bats – zoonotic and conservation implications from a One Health perspective

DeeAnn M. Reeder[1], Kenneth A. Field[1]

[1]Department of Biology, Bucknell University

Objectives: Risks of zoonotic spillover are likely related to the overall health of the animal host. For bat hosts of viral zoonotic diseases, the relationship between health and spillover risk is complex, with poor health possibly favoring transmission by increasing viral load and shedding but also decreasing animal mobility and human-host contact. Unfortunately, determining the health status of free-ranging bats is fraught with difficulty. Challenges exist not only in deciding which diagnostic measures to use, but also in interpreting the results of these measures. Furthermore, without the ability to measure fitness in these long-lived mammals, our understanding of the consequences of "good" or "bad" health for a free-ranging bat is poor. Our objective is to provide a framework for defining bat health that will facilitate bat studies and will enhance our understanding of spillover risk, ecosystem health, and human health. **Methods:** We combined an extensive literature review of health metrics in free-range wildlife, including bats, with our own long-term field studies and experiences studying bat physiology and disease. **Results:** Literature review and our past work point to several findings: (1) a number of measures commonly used in other vertebrate taxa and in other mammals have not been fully deployed for bats – sometimes owing to methodological hurdles; (2) due to a lack of tools, and often small sample volumes, most bat studies have relied on too-few measures, such as BMI (which suffers from allometric problems and is often surprisingly uninformative), the ubiquitous neutrophil-to-lymphocyte (N/L) ratio, ectoparasite load, and highly variable immune metrics such as hemmaglutination assays; (3) newer molecular methods, such as transcriptomic approaches hold promise for improving our understanding of bat health, especially when integrated with other measures such as infection status. We will present preliminary data from our recent field studies of African fruit bats in which we have deployed 20+ field diagnostic measures in combination with infection status and a transcriptomic approach. **Conclusions:** We recommend the development of integrative health metric(s), which will allow for the determination of the most informative measures for future studies. We also implore researchers to document normative physiological measures for more species of bats, analyzed with regards to life history, ecology, and phylogeny.

Host-pathogen interactions during white-nose syndrome

Ken Field[a], Sophia M Reeder[a], Jonathan M Palmer[b], Brent J Sewall[c], Jenni M Prokkola[d], Greg Turner[e], Thomas M Lilley[f], Marianne Gagnon[c], J Paul White[g], Joseph Johnson[h], Christopher Hauer[c], and DeeAnn M Reeder[a]

[a]Department of Biology, Bucknell University, Lewisburg, PA; [b]Center for Forest Mycology Research, Northern Research Station, US Forest Service, Madison, WI; [c]Department of Biology, Temple University, Philadelphia, PA; [d]University of Eastern Finland, Joensuu, Finland; [e]Wildlife Diversity Division, Pennsylvania Game Commission, Harrisburg, PA; [f]Institute of Integrative Biology, University of Liverpool, Liverpool L69 3BX, UK; [g]Wisconsin Department of Natural Resources, Madison, WI ; [h]Biological Sciences, Ohio University, Athens, OH

Objectives: We have employed a dual RNA-Seq approach to study gene expression of both host and pathogen during the fungal infection that causes white-nose syndrome (WNS) in bats. **Results**: We have found that when *Pseudogymnoascus destructans* is causing WNS, the most significant differentially expressed genes in the pathogen were involved in heat shock responses, cell wall remodeling, and micronutrient acquisition. These results demonstrate that this fungal pathogen responds to host-pathogen interactions by regulating gene expression in ways that may contribute to evasion of host responses. We have also found that host responses vary between susceptible and resistant species of bats in ways that may indicate that host responses contribute more to pathogenesis than to protection. This may be because, during hibernation, host immune responses are too costly and lead to premature depletion of energy reserves. We have also determined which host transcriptomic responses to fungal infection can occur during torpor and which require arousal to euthermy. We found relatively few host transcripts that showed significant changes in expression levels due to fungal infection in torpid bats compared to euthermic bats. **Conclusions**: These results support the view that torpor is a period of relative dormancy and suggest that periodic euthermic arousals exist to provide an opportunity for host responses to pathogens.

Resistance or Tolerance – How do European bats cope with *Pseudogymnoascus destructans*?
FRITZE M[1,2], VOIGT CC[2], CZIRJAK GA[2], PUECHMAILLE SJ[1,3].

[1] Zoology Institute,University of Greifswald,Soldmann-Str. 14, D - 17487 Greifswald, Germany; [2] Leibniz institute for Zoo and Wildlife Research, Alfred-Kowalke-Str. 17, 10315 Berlin, Germany and [3] School of Biology and Environmental Sciences, University College Dublin, Belfield, D4 Dublin Ireland

Objectives: *Pseudogymnoascus destructans* (*Pd*), the causing agent of the White-nose disease, colonizes bats during hibernation. The cold-loving fungus affects the snout and all the hairless skin membranes of torpid bats where it causes lesions. The spreading epidemic in North America (so called White-nose syndrome) is characterized by mass mortalities and regional extinctions of certain bat populations. In Europe, *Pd* has been recorded since several decades as a widespread pathogen, yet it does not cause mass mortalities. Several studies confirm that *Pd* is native to Europe and appeared as a new pathogen in North America in 2006. If and how European bats adapted to the disease and why North American bats cannot cope with the fungus remains unclear. **Methods**: We analysed data from over 300 hibernacula across Europe to test for factors influencing mortality, including *Pd* infections on bats. **Results**: Our results show an overall low mortality rate of bats in Europe with no evidence of *Pd*-associated mortalities. Physiological data and blood samples from infected and non-infected European bats were analysed to investigate, if bats suffer from White-nose disease and how the immune systems reacts to fungal infections during hibernation. **Conclusions**: Our ecological, physiological and immunological results suggest resistance and tolerance of European bats towards *Pd*.

Modeling the impact of White-nose syndrome on two western bat species
C. Reed Hranac[1], Brandon J. Klüg-Baerwald[2], Yvonne A. Dzal[3], Cori Lausen[4], Jonathan C. Marshall[1,5], Sarah H. Olson[6] , David T. S. Hayman[1]

Affiliations: [1] Hopkirk Research Institute, Massey University, Private Bag, 11 222, Palmerston North 4442, New Zealand; [2] Department of Biology University of Regina, Regina, SK, Canada, 3737 Wascana Parkway, Regina, SK S4S 1T8; [3] Department of Zoology, University of British Columbia, Vancouver, BC, Canada #4200-6270 University Boulevard, Vancouver, BC V6T 1Z6, [4] Wildlife Conservation Society Canada, Kaslo, BC, Canada, P.O. Box 606, 202 B Ave, Kaslo, BC V0G 1M0; [5] Institute of Fundamental Sciences Massey University, Private Bag 11 222, Palmerston North 4442, New Zealand; [6] Wildlife Conservation Society, Wildlife Health Program 212 South Wallace Avenue, Suite 101, Bozeman, MT, 59715, USA

Objectives: The rapid westward spread of white nose-syndrome (WNS) through North America has become a critical conservation issue for endemic hibernating bat species with many Eastern populations experiencing steep declines over the last ~10 years. The continued spread of the psychrophilic fungus *Pseudogymnoascus destructans* into Western states over the last two years has the potential to impact many hibernating species. Disease outcome varies widely between species, with infection of some species (namely European and Asian species) being largely benign. The identification of species that may be threatened is paramount to development of effective conservation strategies. **Methods:** Using field obtained morphometric data in conjunction with experimentally obtained estimations of key metabolic parameters we applied a modified hibernation model that includes fungal growth dynamics for two currently unaffected North American bat species: *Myotis californicus* and *Myotis yumanensis*. **Results:** Infection of *P. destructans* would likely reduce the maximal time spent in hibernation for both Western *Myotis* species. Reductions of maximal time spent in torpor were predicted to be the most drastic in microclimates with relative humidity approaching saturation and temperatures between ~5 °C and 10 °C. Despite the increased rate of overwinter energy consumption, fat reserves were still predicted to be sufficient to overwinter throughout the majority of their distribution. **Conclusions:** *M. californicus* and *M. yumanensis* are predicted not to experience distribution wide population declines like those witnessed for *M. lucifugus* and *M. septentrionalis* in eastern North America. Continuing field studies will provide data on important model parameter estimations, more species, realized hibernacula microclimate selection, and providing data to empirically validate model predictions.

Variable behaviors influence species susceptibility to disease – surviving white-nose syndrome.
Paul M. Cryan, Research Biologist,
U.S. Geological Survey (USGS), USGS Fort Collins Science Center, 2150 Centre Ave., Bldg. C, Fort Collins, Colorado 80526; cryanp@usgs.gov

White-nose syndrome (WNS) continues to spread through populations of hibernating bats in North America, causing unprecedented mortality in several species occurring in eastern parts of the continent. Despite this devastation, other bat species that come into contact with the causative fungus, *Pseudogymnoascus destructans*, somehow survive. We still do not understand factors influencing species and continental differences in bat

susceptibility to WNS, but variability of innate behaviors among taxa and regions may help explain disease survival. This talk focuses on evidence suggesting infected bats can exploit 'survival habitats' (e.g., hibernacula with palliative microclimates) and 'survival behaviors' (e.g., palliative ways of regulating body temperature during winter). Our search for survival habitats and behaviors in WNS bats illustrates the challenges of understanding how microorganisms influence their cryptic hosts, how unknown host behaviors can obscure understanding of disease, and how new bat research methods may help overcome some of these challenges.

Emerging Insights into the Geographic Distribution, Genetic Diversity and Evolutionary Origin of Bat-borne Hantaviruses

Satoru Arai[1], Se Hun Gu[2], Son Truong Nguyen[3], Vuong Tan Tu[3], Blaise Kadjo[4], Burton K. Lim[5], Joseph S. Masangkay[6], Saw Bawm[7], Joseph A. Cook[8], Shigeru Kyuwa[9], Keiko Tanaka-Taya[1], Shigeru Morikawa[1] and Richard Yanagihara[2]

[1]National Institute of Infectious Diseases, Tokyo, Japan; [2]University of Hawaii at Manoa, Honolulu, HI, USA; [3]Institute of Ecology and Biological Resources, Vietnam Academy of Science and Technology, Hanoi, Vietnam; [4]University of Félix Houphouët-Boigny, Abidjan, Côte d'Ivoire; [5]Royal Ontario Museum, Toronto, Canada; [6]University of the Philippines Los Baños, Laguna, Philippines; [7]University of Veterinary Science, Nay Pyi Taw, Myanmar; [8]University of New Mexico, Albuquerque, New Mexico, U.S.A.; [9]University of Tokyo, Tokyo, Japan;

Objective: The recent discovery of genetically distinct hantaviruses in multiple species of shrews and moles (order Eulipotyphla) prompted a further exploration of their geographic distribution, genetic diversity and evolutionary relationships by analyzing tissues and feces from bats (order Chiroptera). **Methods:** Total RNA, extracted from frozen, ethanol-fixed or RNAlater®-preserved archival tissues (lung, liver, kidney, intestine, intercostal muscle) and rectal swab/feces of 1,890 bats, representing 10 families (Emballonuridae, Molossidae, Mormoopidae, Nycteridae, Phyllostomidae, Vespertilionidae in the Yangochiroptera suborder, and Pteropodidae, Hipposideridae, Megadermatidae, Rhinopholidae in the Yinpterochiroptera suborder), collected in Asia (China, Korea, Malaysia, Mongolia, Myanmar, Philippines, Republic of Georgia, Vietnam), Africa (Côte d'Ivoire, Guinea, Liberia) and the Americas (Bolivia, Brazil, Guyana, USA) during 1981–2015, were analyzed for hantavirus RNA by nested RT-PCR. Phylogenetic analysis was performed using maximum likelihood and Bayesian methods. **Results**: Hantavirus RNAs were detected in 2 of 12 *Neoromicia nanus* from Côte d'Ivoire (Mouyassué virus, MOYV), 6 of 49 *Hipposideros pomona* and 1 of 5 *Hipposideros cineraceus* from Vietnam (Xuan Son virus, XSV), 1 of 12 *Aselliscus stoliczkanus* from Vietnam (Dakrong virus, DKGV), 2 of 13 *Taphozous melanopogon* from Myanmar (Laibin virus, LBV), and 1 of 15 *Rousettus amplexicaudatus* from the Philippines (Quezon virus, QZN). Multiple attempts to acquire whole genomes of the newfound hantaviruses were unsuccessful, except for DKGV and QZNV. Phylogenetic analyses indicated incongruent topologies for each genomic segment, presumably because of the limited sequences available for most of the hantaviruses harbored by bats, shrews and moles. However, in both the S- and L-segment trees, QZNV appeared to share a common ancestry with XSV and LBV. Based on the host cytochrome *b* sequences, the phylogenetic positions of bats in the Yinpterochiroptera and Yangochiroptera suborders were consistent with the phylogenetic relationships among the bat-borne hantaviruses. **Conclusions:** Other research teams have reported Magboi virus in *Nycteris hispida* from Sierra Leone, Makokou virus in *Hipposideros ruber* from Gabon, Huangpi virus in *Pipistrellus abramus* from China, Longquan virus in *Rhinolophus affinis, Rhinolophus monoceros* and *Rhinolophus sinica* from China, Laibin virus in *Taphozous melanopogon* from China, and Brno virus in *Nyctalus noctula* from the Czech Republic, bringing to 11 the number of bat-borne hantaviruses to date. As in shrews, moles and rodents, the same hantavirus species was occasionally found in more than one bat species, and the same bat host species occasionally harbored more than one hantavirus species, suggesting that the formerly held conventional view of one hantavirus species and one host species is no longer tenable. Moreover, the basal position of the chiropteran-borne hantaviruses in phylogenetic trees and the demonstration that bat species in both suborders harbor hantaviruses suggest that primordial hantaviruses may have emerged in an early common ancestor of bats or other members of the Laurasiatheria superorder, that includes shrews and moles.

Neotropical Bats that Co-habit with Humans Function as Dead-End Hosts for Dengue Virus

Amanda Vicente-Santos[1,2], Andres Moreira-Soto[1,4], Claudio Soto-Garita[1], Luis Guillermo Chaverri[3], Andrea Chaves[2], Jan Felix Drexler[4,5], Juan Alberto Morales[6], Alejandro Alfaro-Alarcón[6], Bernal Rodríguez-Herrera [2] and Eugenia Corrales-Aguilar [1*]

[1]Virology-CIET (Research Center for Tropical Diseases), Microbiology, University of Costa Rica, San José, Costa Rica. [2]Biology, University of Costa Rica, San José, Costa Rica. [3]Exact and Natural Sciences School, National Distance Education University, San José, Costa Rica. [4]Institute of Virology, University of Bonn Medical Centre, 53127 Bonn, Germany.[5]German Centre for Infection Research, Bonn-Cologne, Germany.[6] Department of Pathology, School of Veterinary Medicine, National University, Costa Rica

Objective: Several studies have shown Dengue Virus (DENV) nucleic acids and/or antibodies present in Neotropical wildlife including bats, suggesting that some bat species may be susceptible to DENV infection. Here we aim to elucidate the role of house-roosting bats in the DENV transmission cycle. **Methods**: Bats were sampled in households located in high and low dengue incidence regions during rainy and dry seasons in Costa Rica. We captured 318 bats from 12 different species in 29 households. Necropsies were performed in 205 bats to analyze virus presence in heart, lung, spleen, liver, intestine, kidney, and brain tissue. **Results**: Histopathology studies from all organs showed no significant findings of disease or infection. Sera were analyzed by $PRNT_{90}$ for a seroprevalence of 21.2% (51/241), and by PCR for 8.8% (28/318) positive bats for DENV RNA. From these 28 bats, 11 intestine samples were analyzed by RT-PCR. Two intestines were DENV RNA positive for the same dengue serotype detected in blood. Viral isolation from all positive organs or blood was unsuccessful. Additionally, viral load analyses in positive blood samples by qRT-PCR showed virus concentrations under the minimal dose required for mosquito infection. Simultaneously, 651 mosquitoes were collected using EVS-CO_2 traps and analyzed for DENV and feeding preferences (bat cytochrome b). Only three mosquitoes were found DENV positive and none was positive for bat cytochrome b. Our results suggest an accidental presence of DENV in bats probably caused from oral ingestion of infected mosquitoes. Phylogenetic analyses suggest also a spillover event from humans to bats. **Conclusion**: Therefore, we conclude that bats in these urban environments do not sustain DENV amplification, they do not have a role as reservoirs, but function as epidemiological dead end hosts for this virus.

Novel Gammaherpesvirus in Bats: discerning the secrets of these oncogenic viruses

Sonu Subudhi[1], Noreen Rapin[1], Janet Hill[1] and Vikram Misra[1]

[1]Department of Veterinary Microbiology, University of Saskatchewan, Saskatoon, Canada

Objectives: *Gammaherpesvirinae* is a subfamily of herpesviruses which often cause lymphoproliferative diseases and have been linked to two human lymphoid cancers – Burkitt's lymphoma and Kaposi's sarcoma. Anecdotal evidence suggests that bats have lower rates of cancer than other mammalian species. This phenomenon may be because bats have evolved efficient mechanisms for detecting and repairing damaged DNA as a by-product of flight. How such a mechanism affects the interaction of Gammaherpesviruses (which cause cancer) with their bat, hosts is largely unknown. **Methods and Results:** We have isolated a novel Gammaherpesvirus (*Eptesicus fuscus* herpesvirus – EfHV) from a North-American Big Brown bat (*Eptesicus fuscus*). We have used a big brown bat cell line to study the growth kinetics of the virus. We have also performed electron microscopy and PCR to confirm that the virus belongs to the herpesvirus family. To determine the sequence of the herpesvirus, we have performed next generation sequencing (NGS) using Illumina mi-seq. Using the sequence obtained, we have performed phylogenetic analysis from which we found that although the EfHV belongs to the sub-family of Gammaherpesvirus, it forms a distinct branch within the sub-family. In addition to that we have identified the different proteins present in the virion by performing mass spectroscopy and have found that the virion components are similar to other herpesviruses. We have also infected cells of different species with the EfHV to understand the spectrum of different species that this virus is capable of infecting and we have found that it is able to infect human, monkey, porcine and feline cell lines apart from the bat cell line. **Conclusions:** The phylogenetic analysis shows that EfHV is a distant relative of all other gammaherpesviruses known so far. It might have evolved together with the big brown bat. Further studies looking at the interaction of EfHV and big brown bat might help us understand more about the persistent infection in bats and their unique was of resisting cancer.

Experimental Infection of Jamaican Fruit Bats (*Artibeus jamaicensis)* with Zika Virus

Ashley Malmlov[1], Kaitlyn Miedema[1], Tawfik Aboellail[2], Corey Rosenberg[1], Miles Eckley[1], Nunya Chotiwan[1], Rebekah C. Gullberg[1], Rushika Perera[1] and Tony Schountz[1]

[1]Arthropod-Borne and Infectious Diseases Laboratory, Department of Microbiology, Immunology and Pathology, College of Veterinary Medicine and Biomedical Sciences, Colorado State University, Fort Collins, Colorado, USA and [2]Veterinary Diagnostic Laboratories, Department of Microbiology, Immunology and Pathology, College of Veterinary Medicine and Biomedical Sciences, Colorado State University, Fort Collins, Colorado, USA

Objectives: Zika virus (ZIKV) emerged in the New World with the 2014 outbreak in Brazil. It has spread to much of South America, Central America, Mexico and the Caribbean, with hundreds of thousands of cases. While disease presentation may be subclinical to mild and include symptoms of maculopapular rash, conjunctivitis, and arthralgia, infection of pregnant women can lead to fetal microcephaly. Additionally ZIKV infection can induce Guillain-Barre syndrome. In the 1950s and 1960s bat species were investigated as possible reservoirs for ZIKV. In total, five different species of bats were found to be susceptible to the virus. Bats seroconverted, had viremia,

and, in one experimental infection study bats developed fatal neurological disease. This warranted further investigation of ZIKV in bats to determine their use as an animal-model, and to better understand the potential role of bats in viral ecology. **Methods:** Nine Jamaican fruit bats (*Artibeus jamaicensis*) were subcutaneously inoculated with $7.5x10^5$ pfu of ZIKV strain PRVABC59 and monitored over the course of 28 days, during which there were no conspicuous signs of disease. Bats were euthanized at 2, 5, 10 and 28 days post-inoculation to assess the course of infection and antibody responses. **Results:** Bats seroconverted by day 28 by ELISA with ZIKV-infected, fixed Vero E6 cells. Low levels of viral RNA were detected in one brain and one urine sample. IHC detected ZIKV antigen in lung and testes of one bat, and brains and salivary gland of two others. Pathology was consistently observed in the lungs, heart, testes and brain. Pneumonia was observed in four bats, cardiomyocyte necrosis in three bats, degeneration and lymphocyte infiltration in the testes of two bats, and neuronal degeneration in the hypothalamus and cerebellum in three bats. **Conclusions:** These results provide evidence that Jamaican fruit bats are susceptible to ZIKV and may serve as an animal model to study neurological components and sexual transmission of the virus. Low viral load in urine and tissues suggests the role of bats in viral ecology may be minimal.

Long-term monitoring of *Bartonella* bacteria in a captive colony of fruit bats and experimental evidence of bat flies as vectors of bartonella

Clifton McKee[1,2], Colleen Webb[1], Michael Kosoy[2], Ying Bai[2], Lynn Osikowicz[2], Richard Suu-Ire[3], Yaa Ntiamoa-Baidu[4], Andrew Cunningham[5], James Wood[6], David Hayman[7]

[1]Department of Biology, Colorado State University; [2]Division of Vector-Borne Diseases, Centers for Disease Control and Prevention; [3]Wildlife Division, Forestry Commission of Ghana; [4]Department of Animal Biology and Conservation Science, University of Ghana; [5]Institute of Zoology, Zoological Society of London; [6]Department of Veterinary Medicine, University of Cambridge; [7]Institute of Veterinary, Animal and Biomedical Sciences, Massey University

Objectives: Few experimental studies have monitored long-term infection dynamics in bat populations. This is especially true for vector-borne bacteria, where there can be significant challenges in maintaining both host and vector populations in controlled settings. In order to understand the importance of vector populations in the long-term maintenance of infection prevalence and bacterial diversity, we advocate for the use of semi-natural, long-term experiments capable of detecting changes in infection dynamics linked to the force of infection by vectors. **Methods:** Using blood samples taken from a captive colony of ~100 fruit bats (*Eidolon helvum*) in Accra, Ghana from July 2009 - March 2012, we monitored the dynamics of *Bartonella* spp. infection in the bat population using molecular techniques. Over this period, the bat fly population (*Cyclopodia greefi*) infesting the captive bats declined, but was then supplemented with additional flies from wild *E. helvum* in January 2012. We hypothesized that prevalence and species diversity of *Bartonella* infections in the colony will vary with changes in the bat fly population. **Results:** *Bartonella* prevalence and diversity peaked in March 2010 with 77% of bats infected and 8 *Bartonella* spp. present, then began to decline until July 2011 with only 15% of bats infected and 4 *Bartonella* spp. present. After the reintroduction of flies in January 2012, prevalence increased to 43% in March 2012 with 6 species present. Bats that received flies were equally likely to become positive after January 2012 as bats that did not receive flies, which may be attributable to dispersal of flies among bats after reintroduction. Additionally, changes in relative *Bartonella* spp. abundances showed that the species lost over time were uncommon in bats, but some of these uncommon species became more abundant after the reintroduction of flies. **Conclusions:** This experiment indicates that *C. greefi* bat flies are likely vectors of bartonella in *E. helvum* and play an important role in the maintenance of bacterial diversity in bats. Ongoing occupancy modeling work will explore the influence of within-host processes (including bacterial interactions and host resistance to infection) and alternative transmission routes on the long-term infection dynamics in individual bats.

Posters

1. Predicting the epizootiology of temperate bat disease: Is it all about the bats?James N. Aegerter[1], Ashley C. Banyard[2], Anthony R. Fooks[2], Graham C. Smith[1]

[1]Animal and Plant Health Agency (National Wildlife Management Centre), Sand Hutton, York, UK. [2] Animal and Plant Health Agency (Weybridge), New Haw, Addlestone, UK

Predicting the dynamics of disease in wild bats, their epizootiology, and the risks these pose to people, the economy or other biodiversity is complicated. Bats may be the evolved hosts for disease, effective maintenance hosts, or accidental spill-over hosts (we cannot always distinguish which), whilst their unique life-style permits the exceptional natural movement of disease, as well as an exceptional potential to vector disease into homes, farms or other sensitive sites. These diseases may pose social or economic concerns (i.e. to public or livestock health), or produce conservation concerns. Further, diseases may well also be endemic, exotic or newly emerging, and importantly their dynamics today occur in the contexts of rapid land-use change and climate change. With decision-makers relying on the quality of epizootiological predictions, and substantial uncertainty about the pathogen, its pathology in wild bats, a changing environment, and the abstraction of these into mathematical form, it is surprising that little effort has been made to construct and validate mechanistically realistic models of bat populations to act as the solid foundation for higher-level disease modelling. Here we aim to produce a generic tool to provide some evidence based predictions of bat disease epizootiology, founded on a coherent representation of bat ecology and behaviour deployed through an IBM (Individual Bat Model). Importantly, this is founded on an independently validated understanding of their ecology and population dynamics, both of which need to emerge as model behaviour before disease is added. We recognise at least two divergent life-history strategies and lifestyles; ‘slow’ bats, typified by cave hibernators, include a seasonal hierarchical spatial and population structure; ‘fast’ bats show larger but less structured communities. Both accommodate the emerging understanding of bats as social animals as well as assuming that spatial heterogeneity drives some form of meta-population process. Early work has illustrated the surprising variation/instability in demographic structure driven by environmental variation close to range edges (many British bats are at their cold edge in the UK), as well as highlighting basic gaps in knowledge which are pivotal in robust predictions of disease dynamics (males in summer – Where? When? And how much?).

2. **Comparative loss of function screens highlight common cellular pathways required by mumps virus for replication in bats and humans**

[1]Programme in Emerging Infectious Diseases, Duke-NUS Medical School, Singapore; [2]Programme in Cardiovascular and Metabolic Disorders, Duke-NUS Medical School, Singapore; [3]Department of Molecular Genetics and Microbiology, Duke University, Durham, USA; [4]Duke Center for RNA Biology, Duke University, Durham, USA.

Objectives: Bats have been implicated as an important source of new and emerging paramyxoviruses. The identification of bat-borne paramyxoviruses closely related to mammalian paramyxoviruses suggests a possible risk of zoonotic transmission of these paramyxoviruses. Mumps virus (MuV) a contagious virus of the genus *Rubulavirus*, was thought to be an exclusive human pathogen with no animal reservoir. Recently, the complete genomic sequence of a mumps-like rubulavirus was obtained from an African bat. In order to ascertain if bat and human cells are capable of supporting the replication of MuV, and to identify cellular proteins involved in the viral life cycle, we performed comparative genome scale siRNA screens using a human and novel bat siRNA library. **Methods**: Comparative genome scale siRNA screens with MuV were performed. The human MuV siRNA screen (Qiagen) was previously performed in our lab using A549 cells, a human lung adenocarcinoma cell line. A custom bat siRNA library was designed to target 18,328 genes of the *Pteropus alecto* genome. The bat siRNA screen was performed in PaKi cells, a *Pteropus alecto* kidney cell line. **Results**: The coatomer complex I, a known dependency factor was identified as required for MuV replication in both human and bat cells. Eukaryotic initiation factor 3 (eIF3) is a multiprotein complex that functions during the initiation phase of eukaryotic translation was also identified as a host factor. Interestingly, ABCE1, identified as a pan-paramyxovirus host factor, was not required for MuV replication in bat cells. **Conclusions**: This study is the first to utilize a bat genome scale siRNA screen and provides a novel overview of cellular proteins and pathways that impact this important pathogen.

3. **Implementation of a RT-PCR Assay to Detect Henipaviruses in Trinidad Bats**
Victoria Avanzato[1], Neeltje van Doremalen[1], Christine Carrington[2], Janine Seetahal[2], Tony Schountz[3], Vincent Munster[1]

Objectives: Since the emergence of Hendra in Australia, and Nipah in Malaysia and Bangladesh, evidence of henipaviruses in bats has been reported in Thailand, Cambodia, India, Papau New Guinea, China, and Madagascar. Cedar virus, a novel henipavirus, has been isolated from bats in Australia. There has been evidence of seropositivity among humans and *Eidolon helvum* (Straw-coloured fruit bat) bats in Cameroon, as well the publishing of the genome sequence of a henipa-like virus from a bat sample in Ghana. More recently, sequences related to henipaviruses were identified in New World bats, and Brazilian bats were found to have antibodies against henipa-like viruses, though no viral isolate has yet been obtained. This suggests that henipaviruses are likely to exist in other regions, including the Western hemisphere, presenting a need to investigate host populations. The goal of this study is to design a PCR assay to screen bat samples from Trinidad to detect novel henipa or henipa-like viruses.
Methods: Using published primer sets from Tong, et al, and van Boheemen, et al, PCR assays were developed to screen various tissue samples collected from bats in Trinidad. Both primer sets will be evaluated for their ability to detect henipaviruses using viral RNA standards for Hendra, Nipah Bangladesh, and Nipah Malaysia. The 132 samples are from 30 bats, including the species *Saccopteryx bilineata* (greater sac-winged bat), *Carollia perspicillata* (Seba's short-tailed bat), and *Artibeus planirostris* (Flat-faced fruit-eating bat) (sensu Larsen, 2007). Tissues harvested include brain, kidney, liver, spleen, lung, and fetal tissue.
Results: The PCR assay is able to detect viral RNA standards of Hendra, Nipah Bangladesh, and Nipah Malaysia. The assay will be further optimized to screen tissue samples. Samples that screen positive by this assay will be sequencinged.
Conclusions: To our knowledge, no henipaviruses have yet been detected or isolated from New world bats, though studies suggest their presence. Thus, screening for novel henipaviruses in Trinidad bats will help elucidate the full geographic range of these viruses, allowing a better understanding of risks of emergence and outbreaks in humans.

4. **Genomic characterization and pathogenic potential of a novel evolutionarily-divergent alphacoronavirus isolated from *M. lucifigus* bats in Alaska.**

4- Dept. of Veterinary Medicine, University of Alaska Fairbanks

Objectives: Coronaviruses (CoV) are zoonotic pathogens with the potential to cross species barriers from bats into other mammals, including marine mammals, swine and humans. Novel bat-origin coronaviruses have been responsible respiratory disease in humans, notably betacoronaviruses (OC43, HKU-1, SARS and MERS) and alphacoronaviruses (229E and NL63). Thus, it is important to identify the reservoirs of CoV in bats and their potential for transmission, and pathogenicity, in other mammalian species. We sought to analyze the virome of the most common bat species in Alaska, *Myotis lucifugus,* the little brown bat.

Methods: Swabs, tissue, and fecal samples were collected from habitats in close proximity to barns, farm buildings, and human habitations in southcentral Alaska. Total RNA extracts were screened by RT-PCR with coronavirus primers matching CoV ORF1a, and amplicon sequencing. Complete genomes of novel viruses were sequenced by next-generation sequencing (NGS) RNA-seq.

Results: Sanger sequencing of amplicons confirmed the presence of an alphacoronavirus phylogentically related to persistent alphacoronaviruses detected in bats in Colorado and the Rocky Mountains. Primary RNA samples were used in library preparation for short-read, paired-end next generation sequencing on an Illumina HiSeq platform. Aligning to a reference *M. lucifigus* virus from Colorado, bat alphacoronavirus CDPHE15/USA/2006, we assembled a full-length genome (28,515nt) identifying the novel alphacoronavirus/bat/Alaska/s7/2014. A high

degree of thermodynamically stable stem-loop RNA structures are predicted by Mfold within 700nt of 5' and 3' termini of genome**.** While nucleotide conservation to the Colorado virus was 96%, notable amino acid differences were identified in coronavirus proteins. The major CoV surface spike (S) protein exhibited 26 amino acid changes, including 14 in the globular head containing the putative receptor-binding domain, suggesting divergence based on immune evasion or receptor-specificity. Another 6 amino acids were altered in the fusion hinge. Protease cleavage sites were not conserved. Nucleoprotein (N) and ORF3 also exhibited amino acid differences.

Conclusions: Understanding the evolution and pathogenicity of this novel evolutionarily-divergent alphacoronavirus provides insight into the role of bats in virus transmission, and ecological assessment of bat-borne virus reservoirs in North American ecosystems.

5. Preliminary Evidence of Secondary Acquisition of Tymoviridae and Partitiviridae in Little Brown Bats (*Myotis lucifugus*) in Southcentral Alaska.

We sought to analyze the virome of the most common bat species in Alaska, *Myotis lucifugus,* the little brown bat. Swabs, tissue, and fecal samples were collected from habitats in close proximity to barns, farm buildings, and human habitations in southcentral Alaska. Total RNA extracts were screened by RT-PCR and CoV ORF1a, and primary RNA samples were used in library preparation for short-read, paired-end next generation sequencing on an Illumina HiSeq platform. Sanger sequencing of amplicons confirmed the presence of an alphacoronavirus phylogenetically related to persistent alphacoronaviruses detected in bats in Colorado and the Rocky Mountains. In two distinct bat samples, preliminary results indicate the likely presence of tymovirus (eg. Dulcama mottle virus) probably acquired through ingestion of insects feeding on infected plants. In addition, initial results indicate presence of β-partitivirus closely aligned to *Rosellina*-type associated with spruce/alder and other partitivirus-like sequences. Secondary acquisition of virus obtained by feeding or incidental infection by fungi (eg. γ-partitivirus associated with *P. destructans*) has been previously described for bats collected from similar ecological settings (eg. Thapa *et al.* 2016). We continue to further refine these initial for better resolution of the virome of Alaska bats.

6. Molecular Screening of Zika and Dengue Viruses in Bats (*Artibeus jamaicensis, Glossophaga longirostris* and *Molossus molossus*) from Grenada, West Indies.

Marcy Kanuka[1], Ashley Malmlov[2], Christine Cornish[1], Kathleen Parker[1], Cassandra Tang Wing[1], Diana Stone[1], Tony Schountz[2] and Sonia Cheetham[1]

[1]Department of Pathobiology, School of Veterinary Medicine, St. George's University, Grenada, West Indies; [2]Department of Microbiology, Immunology, and Pathology, College of Veterinary Medicine and Biomedical Sciences, Colorado State University, Colorado, USA

Background: In recent years Zika virus (ZikV) has changed from an uncommon and poorly documented infection to a global public health concern. Dengue virus (DenV) has long-standing human health concerns worldwide, including Grenada, and has been detected in bats from other tropical countries. **Objective**: To determine if Grenada bats are infected with ZikV and DenV and thus possible reservoir hosts for these viruses. **Methods**: Forty-nine bats from 3 different genera and feeding behaviours (frugivorous, nectivorous and insectivorous) were trapped and humanly euthanized. ZikV RT-PCR was performed on serum, testes, spleen and brain samples, and a DenV RT-PCR multiplex was performed on serum. Amplicons of the expected sizes were sequenced for confirmation. **Results**: Physical exams prior to euthanasia and sample collection indicated all bats were clinically healthy. All 3 bat species collected tested positive for both viruses. Sera from 27 bats out of 41 tested were positive for ZikV (65.9%) and sera from 12 bats out of 19 tested were positive for DenV (63.2%). All DenV positive bats were infected with serotype 2, with one of these bats testing positive for both DenV serotype 2 and 4. Brains from 22 bats out of 48 tested were positive for ZikV (45.9%). Testes from 2 bats out of 12 tested were ZikV positive (16.7%) and a spleen from one bat out of 22 tested was ZikV positive (4.5%). **Conclusions**: The results demonstrate that frugivorous, nectivorous and insectivorous bats in Grenada are infected with both ZikV and DenV. Of interest is that despite many bats testing positive for ZikV in the brain, all bats appeared clinically healthy with no signs of neurologic dysfunction. Histopathology and immunohistochemistry are pending to

determine if infection is associated with lesions. Virus quantification is currently underway to determine if the level of viremia for either ZikV or DenV is high enough to consider the different bat species as potential reservoir hosts.

7. Serologic evaluation of Alphavirus and Flavivirus exposure in bats in Grenada

Diana Stone[1], Christine Cornish[1], Amy C. Lyons[2], Yan-Jang S. Huang[2], Dana L. Vanlandingham[2], Stephen Higgs[2], Bradley Blitvich[3], Abiodun A. Adesiyun[4], Sharlene Santana[5], Leith Leiser-Miller[5], Sonia Cheetham[1].

[4]Department of Basic Veterinary Sciences, School of Veterinary Medicine, University of the West Indies, Trinidad and Tobago.
[5]Department of Biology and Burke Museum of Natural History and Culture, University of Washington, Seattle, WA, USA.

Objective: Determine exposure to Alphaviruses and Flaviviruses in bats in Grenada. **Methods:** Fifty bats were trapped in August, 2015 in Grenada. Sera from all bats were tested for antibodies to flaviviruses: West Nile virus, Japanese Encephalitis virus, St. Louis Encephalitis virus, Bussuquara virus and dengue virus serotypes 1-4 (DENV-1,2,3,4) using the plaque reduction neutralization test (PRNT). Forty three of the 50 samples were tested for antibody to alphaviruses: Western Equine Encephalitis virus, Venezuelan Equine Encephalitis virus and Eastern Equine Encephalitis virus using epitope-blocking ELISA and 42 samples were tested for antibody to the alphavirus Chikungunya (CHIKV) using PRNT. **Results and Conclusions:** Two species of fruit bats were sampled, *Artibeus jamaicensis*, (48), and *A. lituratus*, (2). Fifteen of the 42 tested positive for neutralizing antibodies to CHIKV at $PRNT_{50}$ with titers 1:10 to 1:640. All 43 bats tested negative for epitope blocking antibody to the other alphaviruses except one positive for Venezuelan Equine Encephalitis virus. All 50 bats tested negative for neutralizing antibody to flaviviruses except one which had a Bussuquara virus $PRNT_{80}$ titer of 20. **Discussion:** Historically, DENV has been endemic in Grenada. CHIKV was introduced to the island in 2014. Bats for this study were trapped a year after the peak human CHIKV epidemic. Of interest is that in a separate study molecular detection confirmed the presence of both DENV and CHIKV RNA in bats serologically tested in this study. Of the 15 CHIKV seropositive bats, one was positive for CHIKV RNA. Of the 50 DENV seronegative bats, 6 showed detection of flavivirus RNA with a band compatible with DEN3. Thus, the negative DENV serology is unanticipated, but may reflect lack of neutralizing antibody responses developed for DENV. Future studies will characterize the humoral immune response to DENV in naturally exposed Grenada bats and determine whether non-neutralizing antibody responses are present. The type of immune response to DENV in bats may promote persistent infection and high-titer viremia and thus contribute to viral maintenance. Our results and those of the molecular study confirm that Grenada fruit bats are exposed to CHIKV and DENV, but their role in the epidemiology of these viruses is currently unknown.

8. **Isolation and molecular characterization of Bukakata orbivirus, a novel virus from a Ugandan bat, and associated pathology in experimentally infected Jamaican fruit bats (*Artibeus jamaicensis*)**

Fagre AC, Kityo R, Lee J, Mossel E, Crabtree, M, Nalikka B, Nakayiki T, Kerbis J, Gilbert, A, Bergren, N, Nyakarahuka L, Lutwama J, Stenglein M, Byas A, Malmlov A, Bergren N, Rice L, Miller B, Schountz T & Kading, RC.

Objectives: In 2013, a novel orbivirus (*Reoviridae: Orbivirus*) was isolated from an Egyptian fruit bat (*Rousettus aegyptiacus*) in Uganda. Preliminarily named "Bukatata orbivirus" after the region where the infected bat was captured, this virus is the fourth identified orbivirus of bats. The genomes of all four bat orbiviruses (Bukakata, Ife, Fomede, and Japanaut viruses) were sequenced to assess their phylogenetic placement within the genus *Orbivirus*, and develop hypotheses regarding virus-vector associations. **Methods:** Whole genomes of all four viruses were sequenced using an Illumina platform and assembled *de novo*. To begin studying the effect of infection with Bukakata orbivirus on a bat host, three male Jamaican fruit bats (*Artibeus jamaicensis*) were inoculated intraperitoneally with 5.3 $\log_{10}$ pfu Bukakata orbivirus and monitored daily for signs of clinical disease. **Results:** Phylogenetic analysis placed Fomede and Bukakata orbiviruses in the tick-borne clade, and Japanaut and Ife in the mosquito/*Culicoides* clade. On day 12, all three bats were diffusely hyperemic and tachypneic and, thus, were humanely euthanized. Histopathologic lesions of perivascular inflammation, hemorrhage and edema were present in varying degree of severity in the liver, lung and kidney of all three bats. Additional lesions included meningeal hemorrhage in two of the bats and evidence suggestive of early hepatic vasculitis in the other. Eosinophilic and suppurative gastroenteritis affected all bats with one containing intraluminal bacilli, suggesting secondary bacterial infection. **Conclusions:** Immunohistochemistry and qPCR will be performed to assess

relative abundance of virus in various organ systems to optimize future analyses. Future experimental infections will be performed to monitor temperature, physiological and immune parameters, virus shedding and viremia throughout the course of infection. These preliminary data are critical in the assessment of the potential role of bats as reservoirs for arboviruses.

9. **Using GIS to Guide Ebola Virus Disease Ecology Field Investigations**

Robert J. Fischer[1], Seth D. Judson[1,2], Sarah H. Olson[3], Vincent J. Munster[1]
[1]Virus Ecology Unit, Laboratory of Virology, Rocky Mountain Laboratories, NIAID, NIH Hamilton, MT; [2]David Geffen School of Medicine at UCLA, Los Angeles, California; [3]Wildlife Conservation Society, Bronx, New York

Objectives: In the health field GIS is being used to track epidemics in real time and to create predictive models of outbreak potential. We have investigated the feasibility of using a maximum entropy model (Maxent) to assist in determining the target species and optimum locations and times to direct field sampling efforts. **Methods:** We developed an ecological niche model of Ebola virus (EBOV) using the location of Ebola virus disease (EVD) outbreak index cases as presence points we developed an ecological niche model to predict geographic locations that had environmental conditions similar to those of known outbreaks. To determine which environmental parameters were important in constructing the model, a correlation matrix was constructed using ArcGIS and highly correlative parameters were eliminated and the model reconstructed. Additionally, home ranges of African mammals were overlaid on a map and compared to the model to determine which species inhabit the geographical regions predicted to be suitable for a spillover event. **Results:** The model was used to highlight environmental factors common to the location of the EVD index cases from 19 environmental parameters and altitude that were used to construct the model. A list of 66 mammals including 26 bat species with home ranges that overlap the modeled range of EBOV was produced. **Conclusions:** While there is no conclusive evidence that bats serve as the reservoir for Ebola virus (EBOV) i.e. there is no wild EBOV bat isolate, there is evidence that they may play a role in maintaining the virus in nature. Combining what is known about the natural histories of bat species and animal species known to be susceptible to EVD such as great apes, duikers and forest hogs coupled with environmental factors predicted to be important, we can further prediction when and where spillover events may occur and tailor our sampling efforts to target these conditions. Additionally, as there is a dearth of knowledge on the natural history of deep forest fruit bats we are planning to monitor the short term daily movements of *Hypsignathus monstrosus* with the aim of being able to predict where the movements of the bats and susceptible species may commonly intersect.

10. **Bat - infection interactions: Signals of evolution, ecology, immunity and deforestation**

Hannah Frank[1], David Enard[1], Chase Mendenhall[1,2,3], Ji-Yeun Lee[4], Ellie Armstrong[1], Stefan Prost[1], Seth Judson[5], Jamieson O'Marr[1], Gretchen Daily[1,3,6], Dmitri Petrov[1], Scott Boyd[4] and Elizabeth Hadly[1,6,7]

[1] Department of Biology, Stanford University; [2] The Nature Conservancy; [3] Center for Conservation Biology, Department of Biology, Stanford University; [4] Department of Pathology, Stanford University; [5] David Geffen School of Medicine, University of California, Los Angeles; [6] Stanford Woods Institute for the Environment, Stanford University; [7] Center for Innovation in Global Health, Stanford University

Objectives: Bats are ecologically diverse and these ecological differences may lead to differences in infection prevalence and identity. We sought to discover the evolutionary and ecological signatures of differences in bat behavior and environment on bat-infection patterns, as well as to understand how these patterns are impacted by human activity. Regions where a high diversity of hosts occur with prevalent deforestation, human habitation and livestock rearing are of great concern for potential spillover. Accordingly, we aimed to characterize infections of potential spillover importance in an altered landscape. **Methods**: Using a combination of genomics, targeted sequence capture and tests of positive selection, we screened 60 species of bats distributed globally for evidence of selection in response to viruses. Additionally, we screened the speciose and ecologically diverse bat fauna of an agricultural landscape in Costa Rica for eight viral groups (Herpesviridae, Astroviridae, Adenoviridae, Paramyxoviridae, Coronaviridae, *Lyssavirus*, Filoviridae, Influenza A), *Bartonella* bacteria and ectoparasites to detect pathogen sharing, immunological and behavioral patterns of infection and the impact of humans on these relationships. **Results**: Evolutionarily, viral sharing has been important for shaping bat immune evolution. However, ecologically most infections are host specific and regulated by host immunity with species that are more frequently exposed less likely to yield detectable pathogen nucleic acids. In deforested areas, these patterns shift in a sex-specific manner, disproportionately impacting females with potential for population stability. **Conclusions**: This study yields evolutionary insights into the unique relationship between bats and viruses, identifying the environmental factors that are driving adaptation. Additionally, it represents one of the broadest infection screening studies in the Neotropics, which has the highest density of bat diversity but is less frequently screened than the Old World. Our data suggest that there are few pathogens of spillover concern circulating in this landscape, but that humans may be having a detrimental impact on bat health.

Daytime behavior of *Pteropus vampyrus* and *Acerodon jubatus* in the natural habitats: a cue of viral transmission

11. Yupadee Hengjan[1], Didik Pramono[2], Hitoshi Takemae[1], Ryosuke Kobayashi[1], Karla Cristine Doysabas[1], Keisuke Iida[1], Takeshi Ando[5], Supratikno[2], Chaerul Basri[2], Yuli Sulistya Fitriana[4], Eko M.Z. Arifin[6], Yasushige Ohmori[1], Ken Maeda[3], Srihadi Agungpriyono[2] and Eiichi Hondo[1]

[1]Graduate School of Bioagricultural Sciences, Nagoya University; [2]Faculty of Veterinary Medicine, Bogor Agricultural University; [3]Joint Faculty of Veterinary Medicine, Yamaguchi University; [4]Research Center for Biology, Indonesian Institute of Science, Indonesia; [5]Japan International Cooperation Agency; [6]Livestock, Fisheries and Marine Services, Indonesia

Objectives: The large flying fox (*Pteropus vampyrus*) are well-recognized host of Nipah virus. Base on serologic studies, the golden-crowned flying fox (*Acerodon jubatus*) are infected with Ebola Reston virus. To estimate the risk of disease emergence, it is important to understand the behavior of flying foxes. This study aimed to clarify diurnal behavior of *P. vampyrus* in Leuweung Sancang conservation area, Indonesia (7º 43′ 45.12″ S, 107º 54′ 10.08″ E), and *A. jubatus* in the Subic Bay Freeport, the Philippines (14º 46′ 31.54″ N, 120º 19′ 14.90″ E). **Methods:** Quantitative behavioral data were collected using instantaneous scan sampling and all occurrence focal sampling methods. **Results:** Unexpectedly, many flying foxes were awake during daytime (*P. vampyrus*: 46.9 ± 10.6%, *A. jubatus*: 23.7 ± 3.1% of scanned bats), and showed various activities. The commonly observed behavior were wing flapping and self-grooming behaviors. Males engaged in sexual activity more than females (*P. vampyrus*: 6.5 ± 1.6 % in males and 0.2 ± 0.1 in females, *A. jubatus*: 1.6 ± 0.5 % in males, 0% in females), sometimes accompanying with aggression behaviors between males and females. There was no significant difference in negative social behaviors (fighting and wing spreading) between males and females of *P. vampyrus*, whereas, the difference was found in *A. jubatus* (2.6 ± 0.7 % in males, 0.1 ± 0.04 % in females). The positive social behaviors (maternal care, mutual grooming and playing) were rarely found in *P. vampyrus*, but never in *A. jubatus*. Physical communications, not only among flying foxes, but also direct and/or indirect contacts between *P. vampyrus* and non-human primate (*Trachypithecus auratus*) were observed (3.3 ± 0.5 times per day). Specifically, periodic disturbance by tourists and unidentified aerial predators like raptors was observed at the roosting site of *A. jubatus*. *A. jubatus* shared the same roosting site with *P. vampyrus*, this enables the contacts between the two species of flying foxes, an average 25.4 ± 6.3 times per day. **Conclusions:** These observations would provide a cue to know how viral transmissions among flying foxes, other wildlife and humans in South-East Asia.

12. The study of whole spike gene of bat coronavirus from Thailand using Next Generation Sequencing

Yutthana Joyjinda[1], Supaporn Wacharapluesadee[1], Prateep Duengkae[2] , Apaporn Rodpan[1], Teerada ponpinit[1], Thongchai Kaewpom[1], Sangchai Yingsakmongkol[3], Kevin J Olival[4], Thiravat Hemachudha[1]

[1] The Thai Red Cross Emerging Infectious Disease Health Science Centre and World Health Organization Collaborating Centre for Research and Training on Viral Zoonoses, Faculty of medicine, Chulalongkorn University, Thailand, [2] Forest Biology Department, Faculty of Forestry, Kasetsart University, Thailand, [3] Faculty of Veterinary Medicine, Department of Microbiology and Immunology, Kasetsart University, Thailand, [4]EcoHealth Alliance, New York, NY, USA

Objectives Bats have been recognized as the natural reservoirs of a vast variety of viruses, including as host to Coronaviruses – a viral family of public health importance. Bat coronaviruses have been intensively studied since the discovery of Severe Acute Respiratory Syndrome Coronavirus (SARS-CoV) and have expanded even more after the emergence of Middle East Respiratory Syndrome Coronavirus (MERS-CoV), both of which are purposed to have originated from bats. Since spike protein is correlated with host cell receptor binding and membrane fusion, a better understanding of sequence diversity for this gene will help determine the potential for host-switching and zoonotic potential of CoVs. The aim of our study was to characterize the spike gene of bat coronaviruses from Thailand. **Methods** we PCR amplify about 4 kb of whole spike gene from seven PCR positive coronavirus of *M. magneter* and *R. shameli* bats from northern part of Thailand and sequencing using Next Generation Sequencing (NGS). Phylogenetic tree of the full alignment of whole spike gene sequences was estimated by maximum likelihood method. **Results** The average of 1,306,845 sequences of spike gene per sample was obtained from NGS. Phylogenetic tree of all seven spike sequences are grouped into the same clade in the alpha Coronavirus (α CoV) and mostly related to the Bat Coronavirus-1A (BatCoV-1A). **Conclusions** Even though seven spike genes of coronaviruses in this study showed sequence different from emerging disease beta coronavirus group B and C (β CoV B and β CoV C); nevertheless, more positive bat coronaviruses should be investigated including whole genome sequencing of bat coronaviruses that may useful for more understanding host-viral evolution and potential for host switching or spillover.

13. **Assessment of the cross-species potential of two emerging coronaviruses, SARS-CoV and MERS-CoV, by Protein-Protein Molecular Docking analyses**
Jun Li & Vincent Munster

Laboratory of Virology, Division of Intramural Research, National Institute of Allergy and Infectious Diseases, National Institutes of Health

Objectives: Coronaviruses are a virus family with broad host range, and have spilled over from their natural reservoirs into various mammalian species, including humans. For humans, four of them cause common cold and circulate exclusively in the human population. In addition, SARS-CoV and MERS-CoV, recently emerged in the human population and are associated with severe respiratory illness. Where do these zoonotic viruses come from, and how did they cross the species barrier? These questions are generally difficult to address. The critical residues at interaction interface of host receptors (DPP4 for MERS-CoV and ACE2 for SARS-CoV) are believed to impact the binding ability of the receptors with viruses' surface-located spike. The diversity of available protein sequences limits our understanding of the receptor-mediated pathogen-host interactions for bat coronaviruses. Computational molecular docking is a bioinformatics tool, which allows us to explore the potential receptor-spike interactions in silico. The aim of this study is to analyze the diversity of SARS-CoV and MERS-CoV receptors from different mammalian hosts, to predict the host range using modeling and molecular docking. **Methods:** Up to 109 DPP4 and 94 ACE2 sequences from mammalian hosts were downloaded from genbank or acquired by sequencing, covering 60 and 51 different families respectively. The putative crystal structures were homologically modeled, and protein-protein docking was performed using Autodock Vina on NIH HPC Biowulf cluster. **Results:** Both of DPP4 and ACE2 receptors sequences from the hosts have relative high diversity. The docking results point out wide but family specific of host range of MERS-CoV and SARS-CoV. Virtual mutagenesis studies explored the impact of each critical residue of DPP4 on binding interaction for *Homo sapiens*, *Mesocricetus auratus*, *Desmodus rotundus*, *Canis lupus familiaris* and *Felis catus*. **Conclusions:** Although currently in silico analysis of spike-receptor interactions utilizing molecular docking methods still are in its early stages of development, the generated results could be utilized to perform large screens of potential virus reservoir, and intermediate hosts associated with emerging coronaviruses, and could potentially be utilized to estimate the distribution of MERS-CoV and SARS-CoV in ecosystems.

14. **Hendra virus phylogeography in eastern Australia**
Kessler MK[1], Kamath PL[2], Smith CS[3], Goldspink LK[3], Plowright RK[1]

[1] Department of Microbiology and Immunology, Montana State University, Bozeman, Montana, USA; [2] U.S. Geological Survey, Northern Rocky Mountain Science Center, Bozeman, Montana USA; [3] Queensland Center for Emerging Infectious Diseases, Biosecurity Queensland, Department of Agriculture and Fisheries, Brisbane, Queensland, Australia

Objectives: Hendra virus (HeV) is an emerging zoonotic paramyxovirus that causes sporadic fatal disease in horses and humans in mainland Australia. Australian flying foxes (*Pteropus* spp. fruit bats), the endemic host, are gregarious, semi-migratory species that occupy the tropical and subtropical forests of coastal Australia. Despite the vast range of flying foxes, current outbreaks of Hendra virus have been restricted to a narrow band in southeast Queensland and northern New South Wales. Transmission dynamics of HeV between flying foxes is poorly understood, which limits our ability to identify potential points for management and spillover prevention. We used a phylogeographic framework to explore the spatial structure of HeV over eastern Australia, and to investigate factors that contribute to maintenance and spread of HeV in flying foxes. **Methods:** A three-year surveillance field study was initiated to improve understanding of Hendra virus diversity and disease dynamics in wild flying foxes, generating partial sequences from 26 colonies across eastern Australia. We incorporated sequenced isolates from spillover events in horses, and applied discrete and continuous Bayesian phylogenetic approaches to explore patterns in the dynamics and spatial spread of Hendra virus. Analysis was performed on a 2015 bp intergenic region between the nucleoprotein and phosphoprotein genes. **Results**: Preliminary analysis indicates a broad spatial structure, with lineages clustering loosely in space and time. However, we also find that multiple variants co-circulate in one colony at any given time, and that identical variants may co-circulate in geographically disparate colonies. Our ongoing approach is to identify drivers in the spatial spread and diversity of Hendra virus by examining the role species composition, roost structure, and migratory behavior play in shaping the geneology of Hendra virus. **Conclusions**: These data suggest that host factors (e.g., species composition within roosts) and/or environmental factors may play a role in HeV circulation within and between bat colonies. This work represents a novel approach to understanding the transmission dynamics and evolution of Hendra virus, as well as the functional connectivity of flying fox populations in eastern Australia.

15. **Viral Zoonosis in Georgian Bats**

Tamar Kutateladze[1], Lela Urushadze[1,3], Davit Putkaradze[1], Magda Dgebuadze[1], Giorgi Babuadze[1], Ioseb Natradze[3], Lillian Orciari[2], and AndresVelasco-Villa[2]

[1] National Center for Disease Control and Public Health Lugar Center, Georgia;
[2] CDC Atlanta, USA; [3]Ilia State University, Georgia

Objectives: Bats are reservoir-hosts of viral agents (lyssaviruses, paramyxoviruses, coronaviruses, and filoviruses), which are transmittable to humans and other animals. There are few bat virus detection studies linked to the Caucasus region. In Georgia, bat *Lyssavirus* (Rabies virus) is listed as a priority pathogen, and West Caucasian Bat Virus (WCBV) is the most genetically different member of the *Lyssavirus* genus. The goal of our study was to find WCBV and the newly discovered bat Coronavirus (bat-CoV) in Georgian bats. **Methods:** Bats that were used for sampling were collected in 2012 from four different regions in Georgia. Bat brains (n=236) were sampled and tested for the presence of lyssavirus antigen by the direct fluorescent antibody (DFA) test. A total of 186 bats of 11 different species were sampled for CoV confirmation. RT-PCR amplification assay targeting the 180 bp fragment within the RNA-dependent RNA polymerase RdRp gene and sequencing of the amplified product was used to confirm the presence of coronaviruses in bat specimens. The PCR product was sequenced on an ABI 3130 Automatic Sequencer. **Results:** None of the bats had detectable antigen consistent with an active infection of related *Lyssavirus* or WCBV. We found an outstanding diversity of CoV strains in Georgia; 54 bats tested positive for CoV. Sequence analysis demonstrated 97- 99% identity to five different types of CoV available at NCBI database. Most CoV positive bats were collected from Imereti, which is located in western Georgia. Bats with a higher prevalence of CoV were *Myotis blhytii* and *Rhinolophus ferrumequinum.* **Conclusions:** Our study revealed that we need additional research for excluding the existence of WCBV in Georgian bats. Future work will include determining the prevalence of rabies virus in these bat samples. To do this, we will perform rabies virus neutralization “Rabies Vaccine Response End-Point Titer (RFFIT)” assays. This was the first study addressing the genetic diversity of bat-CoV in this region. Further analyses and interpretation of the phylogenetic results for CoV will be a benefit for surveillance, system control, and response measures of emerging pathogens in Georgia.

16. Forestalling Future Outbreaks: Enhancing Capacity for Surveillance of Viral Hemorrhagic Fever Viruses in Sierra Leone

Aiah Lebbie[1], Jonathan Towner[2], Ibrahim Bakarr[3], Brian Amman[2], Amy Schuh[2], Jonathan Johnny[3], Tara Sealy[2], James Graziano[2], Celine Taboy[2], John Klena[2], Immah Conteh[1], Stuart Nichol[2], Alusine Koroma[1], Ibrahim Foday[1]and Richard Wadsworth[1]

[1]Department of Biological Sciences, Njala University, Sierra Leone, [2]Centers for Disease Control & Prevention, Atlanta, Georgia, USA, [3]Department of Wildlife Management, Njala University, Sierra Leone

Objectives: The first outbreak of Ebola virus disease in Sierra Leone exposed the limited in-country capacity for effective disease surveillance. Heavy reliance was placed on international support for human, technical and material resources. While the source of the outbreak has not been confirmed, human interactions with wildlife and their habitats continue unabated, raising fears of future outbreaks of zoonotic diseases. Building national level capacity, especially in research universities, would enhance Sierra Leone’s capability to forestall future outbreaks involving viral pathogens of public health concern. **Methods:** Through a collaborative agreement with the Viral Special Pathogens Branch at the Centers for Disease Control & Prevention, staff and students at Njala University have received field and laboratory training in ecological surveillance and molecular diagnosis of hemorrhagic fever viruses in bat populations. **Results:** Training in safe capture techniques, collection of blood/serum samples, necropsy techniques and the safe processing and storage of tissues specimens have been achieved over a period of 18 months for 12 Njala University staff and students. Further, three additional staff and students have been trained in molecular diagnostics using robotic nucleic acid extraction and qRT-PCR methods. These trainings, coupled with the acquisition of laboratory and field equipment and renovations of laboratory space on the Njala University campus and its field research station, are resulting in the inclusion of ecological surveillance and molecular diagnostics of viral pathogens in wildlife populations in the curriculum of Njala University in Sierra Leone. **Conclusions:** Strengthening technical and human capacity for disease surveillance in bats through long-term partnerships with research institutions could lay the foundation for preventing future outbreaks of global concerns.

17. Ecological aspects of bats in a cave frequented by members of the local community in Kaptum Cave in eastern Uganda.

Matovu Benard[1] (Graduate student), Nalikka Betty[2] and Kityo Robert[3]

Makerere University, College of Natural Science – Department of Zoology, Entomology and Fisheries Science Kampala Uganda

Few studies have addressed the ecology of cave bats in Uganda. This study assessed the diversity, roosting and feeding ecology, of micro bats (order *chiroptera*) as well as influence and frequency of human disturbance, in Kaptum cave of Eastern Uganda. Field observations were conducted between July/Augst 2016 and October/ November 2016 to document aspects of roost utilisation by the bats, their feeding choices and human influences on the cave in which 6 species of microchiropteran bats roosted. We used Mist nets and a Harp trap to capture individuals for examination and identification of species present. Infrared Trail trap Cameras were used to monitor roosting habits and activity patterns of the bats in the cave. A portable whether station was used to record the microclimatic conditions in the different sections of the cave in which the bats roosted to evaluate if there was any influence on choice roost. Kaptum cave has 6 species of insectivorous bats which seemed to prefer different sections of the cave. From evidence of insect remains in the roost, the diet of the bats in Kaptum cave consisted of eight insect orders (*Lepidoptera, Coleoptera, Orthoptera, Dictyoptera, Heymenoptera, Isopteran, Hemiptera, and Odonata*) with the order *Lepidoptera* constituting the bulk of insects preyed upon. At the moment we cannot separate the diet of the different species, since most insect remains were recovered in a section the cave we refer to as the Nycteris corner, because it was most used by these bats, but other species of Rhinolophids and Hipposiderids also frequented this corner in any 24hr period. We believe that the continued human presence in the cave could have implications for roost stability, but also could predispose the humans to potentially harmful aerosols associated with bats and bat guano.

18. **Middle East respiratory syndrome coronavirus spike plasticity in the context of the common vampire bat (*Desmodus rotundus*) DPP4 receptor.**

Rebekah McMinn[1], Michael Letko[1], Neeltje van Doremalen[1], Kerri Miazgowicz[2], Vincent Munster[1]

[1]Laboratory of Virology, Division of Intramural Research, National Institute of Allergy and Infectious Diseases, National Institutes of Health [2]Department of Infectious Diseases, College of Veterinary Medicine, University of Georgia

Objectives: In 2012, a novel coronavirus, Middle East respiratory syndrome coronavirus (MERS-CoV), was discovered in humans and dromedary camels, although genetic evidence supports a bat ancestor. This range of animal hosts lead us to hypothesize that MERS-CoV can readily adapt to new hosts. The receptor for MERS-CoV, dipeptidyl peptidase 4 (DPP4) has previously been shown to act as a species barrier. By passing the virus over time on cells stably expressing the common vampire bat (*Desmodus rotundus*) DPP4 receptor, which MERS-CoV binds inefficiently, we will determine how potential adaptation in the spike glycoprotein may influence species tropism. **Methods:** We have compared the growth kinetics of MERS-CoV over 72hrs between different bat DPP4 receptors transfected on baby hamster kidney (BHK) cells, which are naturally unsusceptible to MERS-CoV. We then generated BHK cell lines stably expressing the *D. rotundus* DPP4 receptor. By passing MERS-CoV on these cells over time, we hope to observe adaptations in the viral spike protein that allow more efficient viral growth kinetics. Viral genomes containing the relevant mutations can be created through a reverse genetics system and tested for binding affinity and growth potential. **Results:** We show here that MERS-CoV can use DPP4 from different animal hosts, including a variety of bat species. Notably, MERS-CoV can bind and replicate using the *D. rotundus* DPP4 but very inefficiently compared to human DPP4, leading to delayed growth. We observed that MERS-CoV growth on cells stably expressing D. rotundus DPP4 displays a similar inefficient growth pattern as seen previously using a transfection method. **Conclusions:** Our data demonstrates that MERS-CoV can use a diverse set of host species receptors. Although we have successfully generated BHK cells stably expressing *D. rotundus* DPP4, sequencing of the MERS-CoV spike over many passages is needed to identify relevant mutations. The ability of the MERS-CoV spike to adapt to diverse host species receptors may play a significant role in cross-species transmission.

19. **Viral community dynamics of Australian Flying foxes**

Alison J. Peel[1], Victoria Boyd[2], Raina K. Plowright[3], Olivier Restif[4], Gary Crameri[2], John Giles[1], Hamish McCallum[1], Konstans Wells[1]

[1] Environmental Futures Research Institute, Griffith University, Queensland, Australia; [2] CSIRO Australian Animal Health Laboratory (AAHL), Geelong, Victoria, Australia; [3] Montana State University, Department of Microbiology and Immunology, Bozeman, MT, USA; [4] Department of Veterinary Medicine, University of Cambridge, Cambridge, UK

Objectives: Bats are reservoirs for a disproportionate number of zoonotic viruses, with spillover to people and domestic animals resulting in significant public health implications globally. In Australia, bat viral research has largely focused on Hendra virus, yet a diverse viral community has been detected in Australian Pteropid fruit bats (flying-foxes)[1,2]. Additionally, while the four Australian flying fox are capable of being infected with Hendra virus, not all species appear to be equally competent hosts[3,4]. In this context, interactions among co-infecting viruses and the dynamical consequences of these interactions are under- studied. We aimed to gain further insight into bat viral transmission dynamics by exploring dynamics within a multi-host-multi-pathogen framework. **Methods:** To characterise existing knowledge of the bat viral-host community in Australian flying foxes, a systematic literature review of published studies was undertaken and then complimented with additional unpublished data. Using urine samples collected from three of the four Australian flying-fox species in a related field study[6], we utilised a novel high-throughput multiplex PCR[5] to simultaneously detect up to 11 known bat paramyxoviruses. Within a Bayesian framework, we then modelled the monthly presence of different virus species at the roost level in relation to environmental drivers and the co-occurrence of other virus species. **Results:** Results support synchronous shedding pulses of multiple viruses, with significant co-circulation associations between certain virus species. **Conclusions:** Natural host-virus systems comprise complex communities, and our study explores how moving beyond single-pathogen-single host studies of bat pathogen dynamics towards broader consideration of the biotic interactions within viral and reservoir communities could progress our understanding of transmission and spillover of bat pathogens.

20. **The glycoprotein of Nipah virus in Thai bats associated with Nipah virus in Bangladesh**

Ponpinit T[1], Wacharapluesadee S[1], Duengkae P[2], Kaewpom T[1], Yinsakmongkon S[3], Rodpan A[1], Hemachudha T[1]

[1] World Health Organization Collaborating Centre for Research and Training on Viral Zoonoses, Thai Red Cross Emerging Infectious Diseases Health Science Centre, Faculty of Medicine, Chulalongkorn University, [2]Faculty of Forestry, Kasetsart University, [3]Faculty of Veterinary Medicine, Kasetsart University

Objectives Bats have been recognised as a natural reservoirs of a large number of viruses including Nipah virus (NiV) and are associated with human activities which plays important role in the transmission of pathogens from bats to human. Study the glycoprotein NiV protein which plays important role in virus entry into host cells is a crucial in order to know the virus transmission. **Methods** Bat urine were collected from Luang Phrommawat temple, Chonburi province and screened for NiV nucleocapsid by using hemi-nested RT-PCR. The NiV positive urine samples were amplified the whole glycoprotein gene (1.8 kb). The whole sequences of nucleotide and amino acid of NiV glycoprotein were compared with sequences from both Malaysian and Bangladeshi strains from bats and humans. The phylogenetic tree was constructed by comparing amino acid sequence between NiV from Thai bat and NiV Bangladeshi patient. **Results** NiV glycoprotein sequence from Thai bats were homologous with Bangladeshi strain compared to the Malaysian strain. Furthermore, it shared 99.2-100% and 99.2-99.5% identity with nucleotide sequence of NiV glycoprotein from Bangladeshi bats and Bangladeshi patients, respectively. Amino acid sequence of NiV glycoprotein from Thai bats shared 99.8-100% and 99.5-99.7% identity with Bangladeshi bats and Bangladeshi patients, respectively. While, nucleotide sequence of NiV glycoprotein in Thai bats shared only 93.0-93.3% and 93.2% identity with Malaysian bats and Malaysian patients, respectively. Like nucleotide sequence, the amino acid sequence of NiV Thai bats shared only 95.7-96.0% and 95.7% identity with Malaysian bats and Malaysian patients. Phylogenetic analysis of NiV glycoprotein amino acid revealed that the NiV glycoprotein in Thai bats belonged to Bangladeshi patients. **Conclusions** This is the first step to understand the mechanism of NiV entry to the host. The results may indicates that NiV Thai bat strain has the potential to cause infection in humans. NiV glycoprotein and host receptors should be further investigated in order to understand the viral entry mechanism, host range, including intra- and cross-species transmission. Understanding the transmission of NiV from bats to humans is crucial in order to predict and prevent NiV outbreaks.

21. **Genomic characterization and pathogenic potential of a novel evolutionarily-divergent alphacoronavirus isolated from *M. lucifigus* bats in Alaska.**

Jonathan C. Rupp[1], Maegan Lange[1], Megan Howard[2], Anitha Sundarajan[3], Jonny Sena[3], Faye D. Schilkey[3], Molly Murphy[4], Douglas Causey[1], Eric Bortz[1].

[1]Dept. of Biological Sciences, University of Alaska Anchorage; [2]Battelle Memorial Institute; [3]National Center for Genome Resources, santa Fe NM [4]Dept. of Veterinary Medicine, University of Alaska Fairbanks

Coronaviruses (CoV) are zoonotic pathogens with the potential to cross species barriers from bats into other mammals, including marine mammals, swine and humans. Novel bat-origin coronaviruses have been responsible respiratory disease in humans, notably betacoronaviruses (OC43, HKU-1, SARS and MERS) and alphacoronaviruses (229E and NL63). Thus, it is important to identify the reservoirs of CoV in bats and their potential for transmission, and pathogenicity, in other mammalian species. We sought to analyze the virome of the most common bat species in Alaska, *Myotis lucifugus,* the little brown bat. Swabs, tissue, and fecal samples were collected from habitats in close proximity to barns, farm buildings, and human habitations in southcentral Alaska. Total RNA extracts were screened by RT-PCR with coronavirus primers matching CoV ORF1a, and Sanger sequencing of amplicons confirmed the presence of an alphacoronavirus phylogentically related to persistent alphacoronaviruses detected in bats in Colorado and the Rocky Mountains. Primary RNA samples were used in library preparation for short-read, paired-end next generation sequencing on an Illumina HiSeq platform. Aligning to a reference *M. lucifigus* virus from Colorado, bat alphacoronavirus CDPHE15/USA/2006, we assembled a full-length genome (28,515nt) identifying the novel alphacoronavirus/bat/Alaska/s7/2014. A high degree of thermodynamically stable stem-loop RNA structures are predicted by Mfold within 700nt of 5' and 3' termini of genome**.** While nucleotide conservation to the Colorado virus was 96%, notable amino acid differences were identified in coronavirus proteins. The major CoV surface spike (S) protein exhibited 26 amino acid changes, including 14 in the globular head containing the putative receptor-binding domain, suggesting divergence based on immune evasion or receptor-specificity. Another 6 amino acids were altered in the fusion hinge. Protease cleavage sites were not conserved. Nucleoprotein (N) and ORF3 also exhibited amino acid differences. Understanding the evolution and pathogenicity of this novel alphacoronavirus provides insight into the role of bats in virus transmission, and ecological assessment of bat-borne virus reservoirs in North American ecosystems.

22. **Spatial pattern of genetic diversity and selection in the MHC class II DRB of three Neotropical bat species**

Salmier A., de Thoisy B., Crouau-Roy B., Lacoste V. and Lavergne A.

Host–pathogen interactions—greatly influenced by environmental characteristics—are a major determinant of the extensive polymorphism of the Major histocompatibility complex (MHC) genes that play an important role in both resistance and susceptibility to diseases. Amazonia encompasses the greatest bat richness, as well as great landscape diversity. However, there are few studies regarding adaptation to infectious diseases of bats and even less in contrasting environmental conditions. We analyzed the genetic variability and positive selection signatures of the expressed MHC class II *DRB* exon 2 in three sympatric Amazonian bat species, *Carollia perspicillata*, *Desmodus rotundus*, and *Molossus molossus* inhabiting different environments (*e.g.*, forests, edge habitats, and urban areas). The role of the environment on the allelic composition and distribution of the *DRB* gene, as well as the effects of pathogen-mediated selection, recombination, gene conversion, demographic history and population structure on the MHC diversity were investigated. Overall, we identified 23 *DRB* alleles in 19 *C. perspicillata*, 30 *DRB* alleles in 35 *D. rotundus* and 20 *DRB* alleles in 28 *M. molossus*. We found clear evidence of at least two functional *DRB* loci as well as a trans-species mode of evolution within the Phyllostomidae family. Bats inhabiting forest environments presented higher number of alleles, revealing a heterozygote advantage likely associated with higher diversity of microorganisms in forest environments due to greater host species richness and better transmission-promoting parameters compared to disturbed environments. The *DRB* polymorphism was high in all sampling sites and for all species but different signatures of positive selection were detected depending on the environment, suggesting a local adaptation characteristic driven by an area-limited pathogen-mediated selection. The patterns of *DRB* diversity were similar to those of neutral markers for *C. perspicillata* and *M. molossus* while these patterns were different for *D. rotundus* for which a geographical structure was highlighted. These results supported that demographic process acts as an additional force in shaping *DRB* diversity. However, in structured populations, environmental constraints associated with characteristic pathogen pressures are the main drivers of MHC diversity.

23. Establishing a field collection scheme to investigate the role of African fruit bats as the natural reservoir of ebolaviruses

Ken Cameron[1], **Stephanie Seifert[2]**, Shauna Milne-Price[2], Alain Ondzie[1], Trent Bushmaker[2], Jean-Vivien Mombouli[3], Sarah Olson[1] and Vincent J. Munster[2]

[1]Wildlife Conservation Society, 2300 Southern Boulevard, Bronx NY, USA2
[2]Laboratory of Virology, Virus Ecology Unit, Division of Intramural Research, National Institutes of Allergy and Infectious Diseases, National Institutes of Health, Rocky Mountain Laboratories, Hamilton, USA
[3]Laboratoire National de Santé Publique, Brazzaville, Republic of Congo

Objectives: Filoviruses are among the most well-known and well-studied zoonotic pathogens, yet we know little about filovirus populations in their natural reservoirs. Phylogeographic and population genetic studies of filoviruses isolated from their natural reservoirs would shed light on the population structure and evolutionary history of these important zoonotic pathogens. African fruit bats including *Hypsignathus monstrosus* and *Epomops franqueti*, are the candidate natural reservoirs for filoviruses in the *Ebolavirus* genus; however, there have been no successful attempts to sequence or isolate *Ebolavirus sp.* from PCR-positive bats due to low viral copy numbers in the bats and difficulty associated with sampling from wild bat populations. We sought to increase the likelihood of acquiring live virus and viral whole genome sequences through extensive sampling from wild bat species in the Odzala-Kokoua National Park, Republic of Congo, within the geographical area of previous Zaire ebolavirus outbreaks. **Methods:** Multiple capture-release studies were performed to sample fruit bats over a period of four years. Bats were captured by mist netting near an *H. monstrosus* lekking tree and sampled for whole blood in addition to collecting nasal, urogenital, and rectal swabs. **Results:** In total, samples were taken from 456 *H. monstrosus* bats and 43 *E. franqueti* bats across four years of sampling. An additional 57 samples were taken from other bat species. Preliminary serological work shows 4.9% seroprevalence against Zaire ebolavirus in a subset of the *H. monstrosus* bats. **Conclusions:** The field collection efforts have yielded a large number of bats sampled which show a history of Zaire ebolavirus exposure. Future work will focus on detecting active infection with ebolavirus and isolation of live ebolavirus for whole genome sequencing.

24. **Co-infection in Georgian Bats**

Lela Urushadze[1,3], Ying Bai[2], Lynn Osikowicz[2], Ioseb Natradze[3], Ketevan Sidamonidze[1], Davit Putkaradze[1], and Michael Kosoy[2]

National Center for Disease Control and Public Health, Tbilisi, Georgia[1]; Centers for Disease Control and Prevention, Atlanta, USA[2]; Ilia State University, Tbilisi, Georgia[3]

Objectives: Bats have been recognized as natural reservoirs for a variety of zoonotic pathogens. The prevalence of different pathogens in bats could be associated with colony size and migration patterns. In this study, bats were collected from four different Georgian regions (Kakheti, Imereti-Tskhaltubo, Samegrelo, Kvemo Kartli) and were tested for different pathogens that are endemic to Georgia. **Methods**: In total, 218 bats (*Eptesicus serotinus*-20, *Miniopterus shrebersii*-27, *Myotis blythii*-67, *Myotis emarginatus*-38, *Pipistrellus pygmaeus*-12, *Rhinolopus Euriale*-26, and *Rhinolopus ferrumequinum*-22) were tested for four bacterial agents (*Bartonella, Brucella, Leptospira,* and *Yersinia*). Bat kidneys were dissected, and their DNA was tested for *Bartonella*, and *Leptospira*. Spleen DNA was tested for *Brucella* and *Yersinia*, and the intestine DNA was tested for *Yersinia*. Triplex Real-Time PCR (rtPCR) Assay was performed to detect *Brucella* (IS711), *Bartonella* (tmRNA), and *Yersinia* (pal). Singleplex rtPCR was used to identify *Leptospira* (LipL32). Targeting the 16S rRNA gene, conventional PCR was performed to detect multiple bacterial strains. Cultured *Bartonella* isolates of the *gltA* gene were sequenced. **Results:** A total of 113 (51%) were positive for at least one of the four pathogens. Co-infection was detected in different bat species from Tskhaltubo and Kakheti. One Tskhaltubo bat was positive for *Bartonella*, *Brucella*, and *Leptospira*. Two bats from Kakheti were co-infected with *Bartonella* and *Brucella*: (*Myotisblythii* (n=1), and *Miniopterusschreibersii* (n=1). Eighteen bats were co-infected with *Bartonella* and *Leptospira*: *Myotisblythii* (n=15), and *Miniopterusschreibersii* (n=3). Sequencing analysis confirmed a co-infection with two different *Bartonella* sequences from 16 different bats: *Myotisblythii blythii* (n=3), *Miniopterusschreibersii schreibersii* (n=7), *Myotisblythii emarginatus* (n=1), *Rhinolophus euryale* (n=2), and *Rhinolophus ferrumequinum* (n=3). All bats were negative for *Yersinia*. **Conclusions:** Our results indicate that bat colonies in Tskhaltubo have the highest prevalence of infection and co-infection; since these bats are in enclosed, small spaces such as caves, this may be a reason we see a mixture of pathogens and mutation. In the past couple of years', Georgian caves have become a popular tourist attraction; from a public health standpoint, it is important to know what types of pathogens exists in these local bats.

25. Caves of Myanmar: a high-risk human-wildlife interface for zoonotic disease
Megan E. Vodzak, MS, MPH[a], Ohnmar Aung, MBBS, MA [a], Marc T. Valitutto, VMD[a], Kyaw Y. N. Tun, BVSc, MSc, PhD [a], Heather S. Davies, MS [b], Michael E. von Fricken, PhD, MPH [a,b], Suzan Murray, DVM, DACZM[a], and Dawn M. Zimmerman, DVM, MS[a]

[a] *Global Health Program, Smithsonian Conservation Biology Institute, Washington, DC, USA*
[b] *Department of Global and Community Health, George Mason University, Fairfax, VA, USA*

The Southeast Asian country of Myanmar has been deemed a “hotspot,” both in terms of its biodiversity and disease emergence potential. Despite this recognition, there is a paucity of data and limited surveillance on emerging infectious diseases in Myanmar, due in part to almost five decades of political isolation. Recent changes in the government have expanded economic development, strengthening trade with neighboring countries and opening border access to tourists and investors, further contributing to potential underlying drivers of disease emergence. Of particular import and concern are zoonotic diseases arising from human-animal contact. The vast cave and karst system of Myanmar presents an understudied interface between humans and wildlife, such as bats, rodents, and non-human primates. Caves, particularly where intricate Buddhist shrines have been installed, are popular destinations for local, national, and international visitors despite high-contact potential with animals and their excrement. This poster underscores the growing risk of bat-borne pathogen exposure in relation to cave utilization in Myanmar, exemplified by the popular tourist destination town, Hpa-An.

26. **Prevalence Patterns of Coronaviruses in Lyle's flying fox (*Pteropus lylei*) in Thailand**
Supaporn Wacharapluesadee[1], Prateep Duengkae[2], Aingorn Chaiyes[2], Sangchai Yinsakmongkon[3], Pattarapol Maneeorn[4], Patcharakiti Phengsakul[2], Wachirapon Khumbucha[2], Thongchai Kaewpom[1], Apaporn Rodpan[1], Thiravat Hemachudha[1]

[1] World Health Organization Collaborating Centre for Research and Training on Viral Zoonoses, Thai Red Cross Emerging Infectious Diseases Health Science Centre, Faculty of Medicine, Chulalongkorn University, [2]Faculty of Forestry, Kasetsart University, [3]Faculty of Veterinary Medicine, Kasetsart University,[4]Department of National Parks, Wildlife and Plant Conservation, Thailand.

Objectives Coronavirus (CoV) surveillance in Lyle’s flying fox (*Pteropus lylei*); a medium-sized flying fox which forms large colonies high up in trees in areas close to humans and other animals, was conducted to characterize strain of CoV and determine prevalence patterns in Chonburi province, Thailand. **Methods** *P. lylei* bats were captured monthly during January - December 2012 for detection of CoV at three closed areas in Chonburi province, two human dwellings which were 0.6 (S1) and 5.5 km (S2) away from the bat roost, and a bat roosting site (S3). Two nested RT-PCR of RNA-dependent RNA polymerase (RdRp) from rectal swabs were used for CoV detection. The strain of CoV was confirmed by sequencing and phylogenetic analysis. **Results** From 390 *P. lylei* bats, 239 were male and 151 were female, while 101 were juvenile (forearm length ≤136 mm) and 289 were adult. CoVs were detected in 68 bats, 17.4% using family-wide CoV PCR but not by group C betacoronavirus assay. The positive samples were found in eight months in the year that the study was conducted, the highest in June 2012. Ten mother–pup pairs were captured. Samples from 10 mothers were negative. Rectal swabs from 9 unweaned pups were available for CoV PCR assays and three of them were positive. PCR positive pup was identified with a PCR negative mother. Phylogenetic analysis of conserved RdRp gene revealed that the detected CoVs belonged to group D betacoronavirus (n=64) and alphacoronavirus (n=4). **Conclusions** Younger bats appeared to play a more significant epidemiological role in harbouring CoV. Young age but not sex or gravidity, correlated significantly with CoV detection. CoV was found in unweaned pups whose mothers tested negative for CoV. One possible conclusion is transient shedding from mother during peri-partum to the young, may maintain the virus transmission within the population. The immune status of young and adult bats against CoV, in terms of susceptibility to infection, needs to be studied to explore this. Further study into the association of CoVs with natural hosts is necessary to understand their prevalence and maintenance patterns, to evaluate its zoonotic potential.

27. Genetically Diverse Filoviruses in *Rousettus* and *Eonycteris* spp. Bats, China, 2009 and 2015

Bats have been implicated as natural reservoirs for filoviruses based on serological or nucleotide evidence from 19 bat species in 8 countries across Asia, Africa, and Europe. Previously, we discovered filovirus antibodies in several bat species in China. Here we report genetically divergent novel filoviruses are circulating in the *Rousettus* and *Eonycteris* bats from China. The 310-bp L-gene sequences exhibited 65–99% nucleotide (nt) identity among themselves and 61–78% nt identity with known filoviruses. Phylogenetic analysis of these sequences suggests that at least 3 distinct groups of filovirus are circulating in these bats. Q-PCR results showed these filoviruses were mainly located in the lung, with genome copy number varying from 29 to 523,582/mg of tissue. Thus, these filoviruses may have the potential to be transmitted through the respiratory tract. Co-infection with four different filoviruses was found in a single bat. ELISA and Western Blot showed the antibodies reacting more strongly to EBOV NP than RESTV NP in some filovirus RNA negative bats. One of the viruses named BtFilo9447 were tried to amplify the whole genome. The GP gene of BtFilo9447 shared 34-39% similarity on aa level and 35-53% similarity on nt level with known filoviruses. Our results demonstrate that fruit bats may are important reservoirs of filoviruses. Considering their feeding habitats, fruit bats are often in close contact with domestic animals and human populations. It is therefore necessary to establish long-term and proactive surveillance of these viruses and related diseases.

28. **Development of a monoclonal antibody to Jamaican fruit bat CD3γ**
Miles Eckley, Ann Hawkinson, Tyler Sherman, Tony Schountz, Corey L Campbell

[1]Arthropod-borne and Infectious Diseases Laboratory, Colorado State University and [2]Department of Biology, University of Northern Colorado.

Objective: T cells have critical immunomodulatory roles in the innate immune response to infection. The CD3 cell-surface protein complex is required for T cell activation, and thus treating bats with therapeutic Aj-anti-CD3 IgG antibodies may have immunosuppressive effects. Monoclonal antibodies are of particular interest for this application because of their ability to bind to the Fc receptor of phagocytic and cytotoxic cells and label a pathogen for destruction. Our goal is to investigate the biological mechanisms by which T cells may induce immunopathology in response to viral infection. **Methods**: BALB/c mice were immunized and boosted with a KLH-conjugated 30mer peptide from Jamaican fruit bat CD3γ. Hybridoma cells were produced from the fusion of splenocytes with Sp2/0-Ag14 myeloma cells. Hybridoma cells were selected and cloned on methylcellulose plates, transferred to 24 well plates and supernatants screened. Candidates were identified by ELISA to 30mer peptide conjugated to BSA first, followed by flow cytometry of bat splenocytes. Antibodies were purified from supernatants by affinity chromatography using a protein A/G agarose resin bed. Isotype determination was done by ELISA using HRP labeled mouse anti-IgM, IgG2a, IgG1 and biotin labeled rat anti- IGg2b, IgA and IgG3 primary antibodies. **Results**: Three hybridoma clones for Aj-anti-CD3 IgG were purified from the cell culture supernatants and stored for later use. Each of the three hybridoma clones are expected to have produced a different isotype based on flow cytometry data. **Conclusions**: In future work, we will use Aj-anti-CD3 antibody labelling of T cells in vivo to deplete T cells and determine whether immunopathology to Tacaribe virus, which normally causes fatal infection, will be ameliorated.

29. **Bats and Immunity: Anti-Viral IFNγ Responses Differ Among Hosts**
C. Cotter, T. Schountz, C.L. Campbell

Arthropod-borne and Infectious Diseases Laboratory, Colorado State University

Anti-viral responses in bats (order Chiroptera) is largely unknown to researchers. Although bats account for 20% of all mammal species, they are relatively understudied in the scientific community (Baker et al., 2013). Bats are reservoir hosts for zoonotic diseases such as severe acute respiratory syndrome (SARs), rabies virus, and Ebola virus (Mandl et al., 2015). Reservoir hosts, generally, do not show pathogenic signs or succumb to disease when infected with such viruses. Current efforts by Kuzmin et al to better understand anti-viral responses in Egyptian rousette bat (*Rousettus aegyptiacus*) and human cells include a comparative study of host innate immune response to infection with Ebola virus or Marburg virus. They focused on the interferon (IFN) response. Kuzmin et al. demonstrated that bat IFNγ (type II IFN response) decreased viral replication in cell culture, whereas the human IFNγ produced by the human cells did not. Additionally, IFNγ stimulated the type I IFN (IFNα/β) response Kuzmin et al., 2017). My research focuses on Jamaican fruit bat (*Artibeus jamaicensis*—Aj) IFNg and its role in an anti-viral response to New World mammarenavirus Tacaribe (TCRV). *A. jamaicensis*, when infected with

TCRV, suffer fatal infections (Cogswell-Hawkinson, 2012). Most arenaviruses, TCRV excluded, produce a nuclear protein (NP) that blocks the type I IFN response at interferon response factor-3 (IRF-3) (Martinez-Sobrido et al., 2007). Pathogenesis of TCRV is still unknown; however I hypothesize that it interferes with the IFN response pathway by a different mechanism. Therefore, introduction of therapeutic Aj IFNγ to TCRV infected A. jamaicensis should be able to stimulate an appropriate, anti-viral innate immune response to rescue them from death. My project focuses on cloning, expressing, and purifying Aj IFNγ in order to synthesize a recombinant antibody for Aj IFNγ.

30. **Virome analysis of neotropical bats on the Caribbean island of Trinidad**

Janine F.R. Seetahal[1], Orchid M. Allicock[1,2], Stephen C. Sameroff[2], Christopher Oura[3], Vernie Ramkissoon[1], W. Ian Lipkin[2], Christine V.F. Carrington[1]

[1] Department of Preclinical Sciences, Faculty of Medical Sciences, The University of the West Indies, St Augustine, Trinidad and Tobago; [2] Center for Infection and Immunity, Mailman School of Public Health, Columbia University, New York, USA; [3] School of Veterinary Medicine, Faculty of Medical Sciences, The University of the West Indies, St. Augustine, Trinidad and Tobago

Objectives: Bats are recognized as reservoirs for a number of important zoonotic viruses. The Caribbean island of Trinidad is richly diverse in bat fauna with 68 species recognized. Viruses detected in Trinidad bats include Rabies virus, Tacaribe virus, Rio Bravo virus, Tamana bat virus and more recently a bat coronavirus. The objective of this study was to identify and characterize known and novel viruses in Trinidad bat species. **Methods:** During the period 2012- 2016, bats were sampled from 19 locations in Trinidad. The novel virome capture sequencing platform for vertebrate viruses (VirCapSeq-VERT) was employed to sequence faecal swab samples from 73 bats belonging to seven neotropical species (*Desmodus rotundus, Carollia perspicillita, Uroderma bilobatum, Molossus molossus, Molossus rufus, Pteronotus parnellii* and *Artibeus spp*). Sequence reads were processed using the bioinformatics pipeline at Center for Infection and Immunity to remove host background and assemble contigs that were then subjected to homology search using MegaBlast against the GenBank nucleotide database. Sequences that showed poor or no homology at the nucleotide level were searched against the GenBank viral protein database using BLASTx. The bat fecal samples were also screened by consensus PCR for 8 viral families (*Arenaviridae*, *Herpesviridae*, *Coronaviridae*, *Orthomyxoviridae*, *Alphaviridae*, *Flaviviridae*, *Rhabdoviridae*, *Picornaviridae*) using broadly reactive degenerate primers as outlined in the laboratory protocol for the PREDICT II surveillance project. All PCR products were confirmed by sequencing. **Results:** Consensus PCR detected sequences of Herpesviridae (bat herpesviruses) and Coronaviridae (bat coronaviruses). Preliminary analysis of VirCapSeq-VERT data provided evidence of both known and potentially novel viruses, the majority of which belonged to the families *Anelloviridae*, *Herpesviridae*, *Coronaviridae*, *Orthomyxoviridae*, *Parvoviridae*, *Rhabdoviridae* and *Retroviridae*. The *Anelloviridae* and *Herpesviridae* were detected primarily in fruit bats. The *Orthomyxoviridae* family included Influenza A viruses and were identified in *Desmodus* and *Molossus* species. *Parvoviridae* were overwhelmingly from *Desmodus* and *Artibeus* bats from one trapping site within the same year. *Rhaboviridae* viruses were detected in Desmodus bats sampled from various locations throughout the sampling period. The Retroviridae were primarily previously described bat endogenous retroviruses. **Conclusions:** Our results indicate the presence of a wide range of both known and novel viruses in faeces from Trinidad bats. The limited identification of viruses by consensus PCR as compared to the deep sequencing technique implies that viral detection is more efficient by targeted deep sequencing. Further analysis including targeted PCR and sequencing to assemble full genomes is required to further characterise the viruses detected. Analysis of other tissues will be required to distinguish between bat viral infections and viruses associated with animal prey.

31. **Delineating the phenotype and function of major lymphocyte populations in the fruit-eating bat, Pteropus Alecto.**

Periasamy P.[1,2], Martínez Gómez J.M.[1,2], Wang LF[3] , and Alonso S.[1,2]

[1]Department of Microbiology and Immunology, [2]Immunology Programme, Yong Loo Lin School of Medicine, Life Sciences Institute, National University of Singapore, Singapore. [3]DUKE-NUS, Singapore.

Objective: The unique ability of bats to act as reservoir for viruses that are highly pathogenic to humans suggests unique properties and functional characteristics of their immune system. However, the lack of bat specific reagents, in particular antibodies, has limited our knowledge of bat's immunity. **Methods and Results**: Here, using cross-reactive antibodies, we report the phenotypic and functional characterization of CD3+ T cell subsets, CD19+ B and NK1.1+ NK cells in the fruit-eating bat Pteropus alecto. Our findings indicate the predominance of CD8+ T cells in the spleen from wild-caught bats that may reflect either the presence of viruses in this organ or predominance of these cells at steady state. In addition, bone marrow of the bat contains over 30% T lymphocytes. This is significantly greater when compared to the T cell percentages in human and mouse bone marrow which ranges between 4% and 8%. Uniquely, a significant proportion of CD3+ T cells in bat spleen constitutively express IL-17A, IL-22 and TGF- at the mRNA level. Hence, the spleen may contain a substantial population of naïve T cells that are programmed to readily differentiate into TH17 cells or Tregs. Furthermore, mitogenic stimulation induced proliferation of bat immune cells and production of cytolytic molecules granzyme and perforin, and cytokines IL-2, IL-10, TNF and IFN. Additionally, we also demonstrate B cell function via calcium flux assay. **Conclusions**: This work paves the way towards a better understanding of bat's immunity that may offer new perspectives of therapeutic interventions for humans.

32. **Seasonal serological signals in viral infections for Madagascar fruit bats**

Cara E. Brook[1], Hafaliana C. Ranaivoson[2], Christopher C. Broder[3], Andrew A. Cunningham[4], Andrea L. Graham[1], Jean-Michel Héraud[2], Louise Wong[4], James L.N. Wood[5], Andrew P. Dobson[1*], C. Jessica E. Metcalf[1*]

[1]Department of Ecology and Evolutionary Biology, Princeton University; [2]Virology Unit, Institut Pasteur of Madagascar; [3]Department of Microbiology and Immunology, Uniformed Services University; [4]Institute of Zoology; Zoological Society of London; [5]Department of Veterinary Medicine; University of Cambridge;
*These senior authors contributed equally to this work.

Objectives: Considerable evidence supports a seasonal driver of bat-borne zoonoses, with most spillover events aligned with the synchronous reproductive season of the bat host in question. Previous modeling work proposes three possible mechanisms which could underpin such seasonality: classic Susceptible-Infectious-Recovered (SIR) dynamics with a seasonal influx of naïve juveniles, Susceptible-Infected-Recovered-Susceptible (SIRS) dynamics with periodic, waning immunity, and Susceptible-Infectious-Latent-Infectious (SILI) dynamics, by which hosts maintain virus persistently but shed seasonally. We fit variations on these contrasting dynamic models to age-seroprevalence data for henipavirus infections in Madagascar fruit bats in order to test these hypotheses. **Methods:** We live-captured, serum-sampled, and extracted lower premolar teeth (under anesthesia) from 340 Madagascan fruit bats (Eidolon dupreanum) over an eighteen-month seasonal trajectory. Serum samples were subjected to Luminex assay for henipavirus antibodies, and teeth underwent histological processing to quantify bat age, resulting in the construction of age-serprevalence curves for heniapivrus exposure in E. dupreanum. We fit variations on SI, SIR, SIS, and SIRS compartmental models to these data and used generalized additive models (GAMs) to investigate seasonal variation in antibody titers for both sexes, including several individuals recaptured across our time series. **Results:** Seroprevalence to henipavirus increased with age across the early years of life in our dataset, then declined to zero in later life. Field data were best fit by either frequency-dependent transmission models incorporating infection-induced mortality or by density-dependent transmission models, allowing for rapid waning of immunity. GAM analysis of seasonal trends showed significant seasonality in an animal's serostatus, corresponding to the nutritional calendar for male bats and the reproductive calendar for female bats. Recaptured individuals demonstrated considerable dynamism in antibody titers, changing serostatus in both directions across our time series. **Conclusions:** Our analyses suggest that henipavirus infections in E. dupreanum fruit bats are governed by highly dynamic transmission mechanisms, involving rapidly waning immunity and seasonal peaks and troughs in infection status. We reject a classic SIR model in favor of a more flexible SIRS or SILI model underpinning viral transmission among bat hosts in our system. More fine-scale field data will be needed to further parse remaining hypotheses.

Subject: Bat One Health Research Network Meeting - July 26 - 28, 2019
Attachment(s): "18th IBRC Phuket 2019[1][2][1].pdf","JKO-ATLV1-SERE-ISOPREP Instructions Feb 2019.docx"

Dear Bat One Health Research Network Participant,

On behalf the Defense Threat Reduction Agency, Biological Threat Reduction Program (DTRA BTRP) supporting global threat reduction networks for bat borne pathogens, we would like to extend a save the date for you to attend our Bat One Health Research Network (BOHRN) Steering Committee meeting in Phuket, Thailand. The meeting will be held 26 – 28 July 2019.

The BOHRN meeting coincides with the International Bat Research Conference (IBRC) 28 – 1 August 2019 in Phuket. If you are able to attend, we would also like to extend an invitation to attend IBRC.

We hope to achieve the following objectives during the Steering Committee Meeting:

1. Facilitate a multi-disciplinary forum for discussion on research methods and practices
2. Characterize global research interests and priorities, and align them with network research focus areas to develop shared resources on the BOHRN website
3. Discuss upcoming opportunities to support regional African bat networks and plan for a future effort in Africa

Should you accept this invitation, *Please follow the travel instructions below my signature block. Letters of Invitation will follow shortly.*

We hope you can join us!
Kind Regards,
Megan

Megan Hudson | ***Project Lead***
Global Systems Engineering, LLC
A Certified HUBZone Company
www.globalsyseng.com

Travel instructions:

Please respond with intent to join to megan.hudson and nicki.d.aleman.ctr *NLT 13 May.*

Please follow up with Nicki Aleman as soon as possible, if you intend to travel; you will likely need to provide Nicki with your passport information, to and from destinations, and travel dates. Logistics support coordinators will work with you to secure all your reservations. Please note that they try to work with your preferences, but must remain within the boundaries of the Department of Defense regulations for travel. *Please be advised, if your trainings are not completed by the assigned date (31 May), funding for travel and conference registration will not be provided.*

18th IBRC Phuket, Thailand - 28 July-1 August, 2019
(International Bat Research Conference)

Following the very successful IBRC conference in Durban, South Africa in 2016, we are pleased to announce that the 18th International Bat Research Conference will be held between 28 July and 1 August 2019 at the Slate Resort, Phuket, Thailand.

The meeting is hosted by Princess Maha Chakri Sirindhorn Natural History Museum, Prince of Songkla University, Thailand, supported by the Harrison Institute, UK.

Over 4 days, the meeting will feature a diverse range of presentations, symposia and workshops on numerous bat research and conservation topics. With an expected audience numbering some 400+ individuals, it is heartening to see that registrations and expressions of interest already include a broad cohort of students, young researchers, and leading authorities from Asia, the Americas, Africa, Australasia, and Europe. The conference is also providing a base on which a number of other bat-related networks are seeking to piggy-back in order to maximise their potential audience. Meanwhile, plenary speakers - all experts in their field - have been invited to address a series of highly topical issues such as bats and emerging disease, bat conservation in multi-occupation landscapes, and sequencing the bat genome. The conference is proving equally attractive to sponsors with a broad range of exhibitors.

As organisers, it is our hope that this meeting will bring together new, innovative ideas about the future of bat research and particularly the future of bat conservation. For this reason, the logo of the 18th IBRC symbolises that the future for bats is in our hands and it is for us to promote their conservation through strategic initiatives, education, and outreach.

We, however, still seeking partnership to support organising the meeting. The particularly crucial support that we really need at the moment is the travel grant for 'student and young/early career scientists'. We believe that support, in any kind, from your organisation will greatly increase the number of attendance and enhance the scientific atmosphere of the meeting.

We look forward to partner up and meeting with you.

Dr Pipat Soisook (pipat66@gmail.com)
Chairman of the Scientific Committee of the 18th IBRC
https://www.ibrc2019.com/

13 February 2019

JKO/ATLV1/SERE/ISOPREP Instructions for Civilian Personnel without an Official Government Email address or a Common Access Card who are Supporting BTRP.
Use your Work Email for Corresponding. Training not required by Foreign Nationals.

This process is for NEW ACCOUNTS ONLY. If you have logged into JKO before, use forgot user name /password if/as needed to recover your Username or Password. Contact JKOHelpDesk@jten.mil or 757-203-5654 for access issues.

To establish a JKO account, click on the following link. http://jko.jten.mil/index.html on the page that opens up, **click on enter JKO**. Read the Security Banner then **click OK**. On the page you are viewing now, under I DO NOT have a CaC, **click on Non-Government Personnel/Sponsored Account Registration**.
On the next page, fill out the requested information. **Enter the email for the Country Manager** you are supporting at BTRP. When you click submit, a notice will be sent to the country manager who will submit your account request.
If needed, John.T.Patterson2.civ@mail.mil can be used as the sponsor. It usually takes 24hrs to establish an account.

To complete:
1. JKO Course # JS-US007: Level I Antiterrorism Awareness Training: Valid for 12 Months.
Once logged into JKO, select the Catalog Tab at top of page and enter "antiterrorism" in title/keyword box, and click search. JS-US007 Level I Antiterrorism Awareness Training – (2hrs) should be listed. Click enroll to access course.

2. JKO Course J3TA-US1329, SERE 100.2 Level A SERE Education and Training in Support of the Code of Conduct (FOUO): Valid for 36 Months or AS REQUIRED BY THE FOREIGN CLEARANCE GUIDE. FREQUENCY SUBJECT TO CHANGE.
Once logged into JKO, select the Catalog Tab at top of page and enter "SERE" in title/keyword box, and click search. SERE 100.2 Level A SERE Education and Training in Support of the Code of Conduct (FOUO) - (4 hrs) should be listed.
Click enroll to access course.

ONCE ANTITERRORISM AND SERE TRAINING ARE COMPLETED, PLEASE SEND A COPY OF THE CERTIFICATES

DO NOT send form by email or regular mail. Once blocks 50-54 are completed the form is classified CONFIDENTIAL. Send using shipping instructions on page 2

3. DD Form 1833 Isolated Personnel Report (ISOPREP): Valid 12 Months or AS REQUIRED BY THE FOREIGN CLEARANCE GUIDE. FREQUENCY SUBJECT TO CHANGE.

If you have a DOD CAC, click on link below and follow instructions to complete your **initial ISOPREP**. You must be on a .mil or .gov domain computer system.
https://prmsglobal.prms.af.mil/prmsconv/Profile/Survey/start.aspx

If you need to update or want to verify your ISOPREP, contact one of the individuals listed below.

If you are in the local area, you may contact John.T.Patterson2.civ@mail.mil / 571-616-5938 to arrange completion of your ISOPREP at the BTRP office. If you receive an out of office response, you may contact theodore.w.carlson.civ@mail.mil / 571-616-6382 for assistance.

PLEASE FOLLOW THE INSTRUCTIONS for the Form.
If you do not have a DOD CAC, and are not in the local area, fill out DD Form 1833. This can be found by searching online. Instructions are included in form. Finger prints are not required. **Your SSN, DOB, Blood type, A Primary Next of Kin, and Your Company and Point Contact are needed. Section 9 blocks 50-54**

should be typed on separate piece of paper and included with the form. Make sure to follow the instructions for the 4 Statements and the Authentication Number. Need to be able to generate 4 questions from each statement. Do not use same # twice, no consecutive #'s, no zeroes. Submit two photos, a front view and right side profile view, from the shoulders up. Photos may be sent with the form or the preferred method is to email the **photos only** to John.T.Patterson2.civ@mail.mil

Mailing Instructions

Seal package with type of tape to retain postal stamp impressions. Prepare, package, and securely seal classified material in ways to MAXIMIZE evidence of tampering and MINIMIZE undetected deliberate compromise, or risk of accidental exposure. To minimize the risk of exposure of classified information, package documents so that classified material is not in direct contact with the inner envelope or container (e.g., fold so classified material faces together).
Double wrap classified information in two opaque, sealed envelopes, wrappings, or containers, durable enough to properly protect the material from accidental exposure and facilitate detection of tampering.
Do not place classification marking or any other unusual marks on the outer package that might invite special attention to the fact that the contents are classified

After completing form, fold so classified information faces together. Place folded form, disk or photos if you did not email them inside fully addressed and marked package as instructed and shown below.

Form

CONFIDENTIAL

DD FORM 1833

Inner Package

Full Name CONFIDENTIAL
Full Address (Mark Front and Back)

ATTN: CT-BT/John Patterson
and BTRP Country Managers
name
Defense Threat Reduction Agency
6200 Mead Road
Fort Belvoir, VA 22060-5624

CONFIDENTIAL
(Mark Front and Back)

Outer Package

Office Name Only
Office Address

See proper address below

Inner Package:

Mark inner package as shown above. Be sure to replace the BTRP Country Managers' name shown with the actual name you are supporting.

- Complete recipients and sender address
- Mark top/bottom and front/ back with CONFIDENTIAL markings.
- Seal package as stated at top of this page.

Place this package inside of another package (outer package).

Outer Package:

Mark outer package as shown above.

- Use only office name and office address. Do not use individual names.
- Do not use markings of any kind indicating classification or that the package contains classified material.
- Seal package as stated at top of this page.
- Send package via USPS, FEDEX, UPS, DHL, etc. Make sure you have a tracking # for Package.
- After sending package notify John.T.Patterson2.civ@mail.mil, and applicable BTRP Country Manager so we are aware to be watching for package.

Use correct address below depending on shipper. Make sure you have a tracking number for your package.

For Registered / Express mail via the US Postal Service	**For Express mail via Federal Express, DHL, UPS**

Subject: Bat One Health Research Network
Attachment(s): "BOHRNVienna_FinalReport[1].pdf"

Dear all,

On behalf of Dr. Marty Stokes, please find the final report for the BOHRN Workshop in Vienna.

As discussed in Vienna, there are several action items for the BOHRN network. In order to move forward on several of these items, we ask that you take a few moments to answer the following questionnaire. This survey will help us to identify BOHRN's efforts and progress towards its overarching goals and evaluate the networks threat reduction efforts. Please follow the link and complete the survey no later than 28 February: https://www.surveymonkey.com/r/6FQPQR3

Additionally, please use the following Drop Box link for access to the BOHRN Workshop participant list with pictures and the quad charts submitted by all participants. You may also access the video of the BOHRN Workshop here.

We had hoped to make a more formal announcement regarding solicitation for BOHRN special projects around this time; however, BTRP is internally still reviewing necessary criteria for award and will not be ready to make a more formal announcement until the April / May timeframe. The announcement will be released via the www.bohrn.net website.

Please let us know if you have any questions or concerns.

Kind Regards,

Megan

BOHRN

The Bat / One Health Research Network

The 1st Annual Bat / One Health Research Network Workshop

8-9 November 2018 • Vienna, Austria

Page intentionally left blank

Table of Contents

Workshop Overview

Executive Summary

The Bat/One Health Research Network (BOHRN) convened its 1st Annual Research Workshop in Vienna, Austria, 7-8 November 2018, in advance of the International Meeting on Emerging Diseases and Surveillance (IMED). This two-day workshop was organized and hosted by the Defense Threat Reduction Agency, Cooperative Threat Reduction Directorate, Biological Threat Reduction Program (BTRP) in its capacity as a sponsor of life-sciences research-based Threat Reduction Networks (TRNs). This event provided an opportunity to advance BOHRN's core agenda of enabling interdisciplinary collaboration at the interface of biological threat reduction, research, and conservation.

The BOHRN initiative was organized at a side-meeting of the 2nd International Symposium on Infectious Diseases of Bats in Fort Collins, CO on 29 June 2017. During this meeting participants established a Steering Committee and began preliminary actions to build a multi-disciplined, self-sustainable network to better characterize global threats of bat-borne pathogens and formalize community standards and conservation- conscientious practices for One Health disease research. During a series of follow-on meetings, members of the BOHRN Steering Committee identified objectives and developed a research strategy to prioritize and target common needs. The BOHRN 1st Annual Research Workshop in Vienna provided an opportunity to validate its research strategy with a wider audience.

The workshop began with a series of introductory presentations from Dr. Martha Stokes, DTRA BTRP, who provided background on her organization and the BOHRN effort. There were also a series of presentations from other subject matter experts who provided short lectures on areas were identified as knowledge gaps by members of the Steering Committee at previous BOHRN meetings (note: the full agenda may be found here). Next, workshop attendees participated in two breakout sessions. The first session focused on the research focus areas within the four (4) BOHRN Working Groups and aimed to solicit feed-back in real time on the short and long-term objectives within each network working group.

The second breakout session was initiated by an interactive exercise, facilitated by Dr. Tigga Kingston (Texas Tech University) and Dr. Jon Epstein (EcoHealth Alliance), mapping the intersectional of ecological and epidemiological research questions. Participants were then divided into regional groups with diverse and varying levels of expertise to sketch out hypothesis-driven research projects that mapped to BOHRN working group focus areas. Members of the BOHRN Steering Committee and other experts were on-hand to provide mentorship and guidance. At the end of the workshop, each project was presented orally by a member of the project team in a mock peer review session for feed-back and discussion.

The output and recommendations gathered from the small-group sessions will inform BOHRN next steps, which Dr. Stokes described at the conclusion of the workshop as a series of special grant awards for project proposals under BOHRN. She described the process as 'still under construction' but affirmed her leadership's commitment to maintain the network's initial momentum. While the exact mechanism and criteria for award are still being discussed, all interested parties may anticipate a call for proposals via the BOHRN website at some point in the spring of 2019.

There are a number of factors that make bats unique disease reservoirs, including their social behavior, distinct physiology and metabolism, ability to travel long distance, nocturnal activity, species diversity, and long life-span. BTRP anticipates that by taking a lead in funding bat-associated pathogen research, their organization can play a significant role in better characterizing the role of bats in global zoonotic disease ecology, coupled with assessing the impact of human-mediated interactions and environmental changes, to better understand threat reduction value of surveillance and intervention efforts.

Previous BOHRN Events

BOHRN Kick-off Meeting

- Concurrent with 2nd International Symposium on EID
- Sponsored by BTRP
- Took place in Fort Collins, CO – 29 June 2017
- **Outcomes:** (1) established a steering committee; (2) drafted terms of reference; (3) identified research areas of interest

BOHRN Steering Committee Strategy Mapping Meeting – 1

- Concurrent with Prince Mahidol Award Ceremony
- Sponsored by BTRP
- Took place in Bangkok, Thailand – 30 January 2018
- **Outcomes:** (1) prioritized research focus areas; (2) developed targeted action plans; (3) drafted associated workplans and timelines

BOHRN Steering Committee Strategy Mapping Meeting – 2

- Concurrent with International One Health Congress
- Sponsored by BTRP
- Took place in Saskatoon, Canada – 20-21 June 2018
- **Outcomes:** (1) completed workplans and timelines for research focus areas; (2) established BOHRN branding and website; (3) drafted communication and outreach strategy

BOHRN Biological Threat Characterization Discussion

- Concurrent with Western Asia Bat Network (WABNet) Kickoff Meeting
- Sponsored by BTRP, organized by EcoHealth Alliance
- Took place in Tbilisi, Georgia – 20 September 2018
- **Outcomes:** (1) identified and characterized regionally-focused gaps and needs (2) activated communication and outreach strategy;

Workshop Outcomes

Presentation Summaries

The following subject matter experts were invited to present on areas that were identified as knowledge gaps in BOHRN. Event participants received a pdf copy of each presenter's slides.

Dr. Jon Epstein

Dr. Jon Epstein, EcoHealth Alliance, presented on *Understanding the Ecology of Emerging Zoonoses*. His presentation focused on the three stages of disease emergence to help understand the complexities of spillover. Starting with the first stage, wildlife and domestic animal interactions, Dr. Epstein explained the movement of microbes into domestic animals. Human's increasing interactions with domestic animals leads to the second stage where the microbe has spilled over into the human population causing widespread outbreaks. The third and final stage of disease emergence is the outbreak reaching pandemic levels. Dr. Epstein proceeded to present two cases Nipah Virus spillover from Pteropid Bats and Nipah Virus spillover from date palm sap harvesting. Both cases were used to support evidence that the driver of spillover is human activity. However, as Dr. Epstein explained, this does not account for why human infections occur a small areas of these bat's known habitats. Therefore, it is important to understand why spillover is only occurring in these small areas, whether it is a rare event or there is a need for more broad spread surveillance.

Dr. Jonathan Towner

Dr. Jonathan Towner, from the Center for Disease Control and Prevention, presented on *Filovirus Maintenance in Nature: Potential Lessons Learned from Studying Marburg Virus*. Dr. Towner's presentation focused on the persistence of Marburg Virus (MARV) in nature supported by the recent study findings that Egyptian Rousette bats are identified as a natural reservoir for MARV. The study looked at bats during birthing and breeding seasons in the Python Cave of Uganda and focused on the impact seasonal pluses have on human spillover. From this study, Dr. Towner presented on the need for messaging to miners and the community to emphasize the importance of bats to the ecosystem and the effects of culling the bats in Python Cave. In addition, the presentation focused on discussing virus transmission from bat to bat, long-term immunity in bats, and the potential to recreate the study with Ebola Virus.

Dr. Brian Bird

Dr. Brian Bird, from the University of California-Davis, presented on *Synergies Between the Bench and the Field for Virus Discovery and Capacity Building*. Dr. Bird's focused on the work of the USAID PREDICT program and the Ebola Host Project. Dr. Bird began his presentation by explaining the challenges of targeted, risk-based surveillance the PREDICT program focuses on. He led into a discussion on virus discovery and detection from identifying viruses by consensus polymerase chain reaction (PCR) supplemented by high-throughput screening (HTS) to performing experiments to understand and rank the potential risk of the virus. Dr. Bird then explained the process PREDICT uses to strengthening laboratory efforts and used the Ebola Host Project in Sierra Leone as an example of

these efforts. The Ebola Host project has led to the training of numerous local scientists and the development of community outreach materials. Dr. Bird's presentation summarized the efforts in Sierra Leone to focus on Filoviruses which has led to identifying new Ebola viruses in insect eating bats before known human or animal sickness.

Dr. Susan Tsang

Dr. Susan Tsang presented on *Flying Foxes as Bushmeat in Sulawesi Indonesia, Building Community Outreach Initiatives Based on Novel Understanding of Who, Where, and Why*. Dr. Tsang began by identifying the common challenges in institutional capacity, identification of stakeholders, interagency coordination, and funding. Her presentation then focused on the flying foxes as bushmeat and the cultural understanding of the drivers for how and why bats are hunted. Dr. Tsang used the outreach initiatives in Sulawesi, Indonesia to emphasize that outreach must include regional level coordination to allow for national level communication at both the front and tail end of any project. In addition, outreach should be designed for the community and the importance of assessing effective ways to disseminate information. Dr. Tsang explained potential resolutions to the common challenges could include providing training on outreach, incorporating voices from all levels of policy, and demonstrating the value to other sectors for interdisciplinary funding.

Breakout Session 1 Overview

In advance of the first breakout session, Dr. Jon Epstein (EcoHealth Alliance) and Dr. Tigga Kingston (Texas Tech University) provided an update from the Steering Committee, summarizing a year's worth of Steering Committee Strategy Sessions. They presented two - three slides per Working Group, summarizing the group's mission, focus areas, objectives, measurements of success, challenges, and timelines. The new participants, who had not been part of previous BOHRN strategy sessions, were able to discuss the slides as a large group, before breaking out into smaller groups to provide constructive feedback and guidance based on their knowledge and experiences. Breakout session discussions led to the development of cross-cutting recommendations on capacity for in region repositories and curation of voucher material and the implementation of a data-sharing culture. The outcome of these suggested recommendations will ultimately build an additional working group.

Steering Committee Presentations

BOHRN planners collated and drafted the following material from the BOHRN strategy sessions, to provide a visual tool to solicit feedback from a group of new stakeholders. This information was presented in slide-form as an introduction to the large-group discussions and break-out group sessions.

Working Group 1: researching host-pathogen biology and interactions

MISSION: EXPLAIN THE DETERMINANTS OF PATHOGEN TOLERANCE, TRANSMISSION, AND SPILLOVER FROM BATS AT INDIVIDUAL AND POPULATION LEVELS

Established Working Group 1 Research Focus Areas

Bat physiology and immunology	Distributions of pathogen amongst species	Bat pathogen community biology	Modeling approaches for host dynamics and epidemiology

Objective		Outcomes
Complete a systematic review of knowledge gaps on model systems	→	Publish a systematic review of modeling systems and knowledge gaps that were defined
Identify modeling systems that are representatives of all geographic and phylogenetic areas	→	Modeling systems are defined, characterized, and validated
Evaluate the transmission risks and spillover pathogens to another animal host	→	Intrinsic and extrinsic risk factors are identified for major diseases and geographic areas

Overall Challenges: (1) Objectives require multidisciplinary team: (2) consortia would be needed for modeling systems review and validation

Established Working Group 1 Research Projects and Activities Priority Timeline

Short-term project / activity pipeline *6 -12 months*	Long-term project / activity pipeline *12 months +*
Map funding landscape ⇒ Identify funders ⇒ Host a funders meeting	Conduct long-term lab and field studies ⇒ Develop cell lines and bat animal models ⇒ IgM immunoassay ⇒ Develop methods for determining the age of bats ⇒ Determine the timing of viral shedding and the effects of environmental stresses ⇒ Determine co-infection in bat species ⇒ Determine temperate versus tropical variables associated with infection (hibernation periods / viral replication) ⇒ Understand climate change with respect to physiology ⇒ Develop heat stable preservatives ⇒ Develop smaller telemetry and physiology sensors

Working Group 2: researching pathogen surveillance, diagnostic capacity and epidemiology

MISSION: FORM REGIONAL NETWORKS TO ESTABLISH A COMMON METHODOLOGY FOR SURVEILLANCE OF HUMAN AND ANIMAL HEALTH; BETTER UNDERSTAND SPILLOVER RISKS AND EPIDEMIOLOGY OF BAT PATHOGENS

Established Working Group 2 Research Focus Areas

Molecular epidemiology	Geographic and phylogenetic distribution of pathogens	Detection, diagnosis, and reporting of bat-borne pathogens	Established guidance and protocols for sampling

Objective		Outcomes
Conduct a gap analysis of existing diagnostic tools	→	Publish review of epidemiology of known bat-borne pathogens
Conduct outreach to various groups of researchers and build awareness amongst public and science community	→	Established and linked regional networks of practice and expertise
Establish a common methodology for surveillance	→	A better understanding of the risks associated with spillover and established standards for surveillance and reporting

Overall Challenges: (1) The logistics and bureaucracy of creating a multidisciplinary team of international experts; (2) funding to support and sustain efforts to standardize surveillance

Established Working Group 2 Research Projects and Activities Priority Timeline

Short-term project / activity pipeline *6 -12 months*	Long-term project / activity pipeline *12 months +*
Conduct a gap analysis of diagnostic tools ⇒ Identify list of labs and contacts ⇒ Create a list for priority interventions / assistance ⇒ Analyze return data; publish resource lists	Conduct surveillance platform assessment ⇒ Conduct a literature review of previous surveillance platform assessments ⇒ Identify most beneficial platform for animal and human health data information sharing ⇒ Identify most logical platform for low resource settings ⇒ Identify the best field-forward platforms

Working Group 3: researching ecology (bat, domesticated animals and wildlife interface)

MISSION: DEFINE HOW AND TO WHAT EXTENT THE ECOLOGICAL CONTEXT OF BATS, AND THE HUMAN INFLUENCE ON THAT CONTEXT, INFLUENCE PATHOGEN DYNAMICS AND SPILLOVER THREATS

Established Working Group 3 Research Focus Areas

Bat behavior, distribution and movement	Effect of anthropogenic disturbance and modification on pathogen dynamics	Domesticated animals and wildlife behavior, distribution, and movement impact on interaction with bats

Objective		Outcomes
Engage the ecological community to define system uniqueness and interdependencies	→	Pathogen research community acknowledges and integrates ecological systems and interdependencies
Advocate for ecological design and analysis frameworks to pathogen research	→	BOHRN research projects are designed using a framework for well-balanced outcomes
Build capacity for disease researchers to gather ecological data to provide context for their studies	→	More funded studies return ecological data
Define emerging ecological principles that could inform spillover threats	→	Emerging ecological principles become widely accepted governing principles for practice
Establish key messages and conduct efforts to promote a culture of conservation amongst One Health researchers, practitioners, and stakeholders	→	BOHRN establishes itself as a consistent and unbiased perspective from the community and its statements are widely accepted and distributed

Overall Challenges: (1) Science communities have polarized and insular view of bats and diseases; (2) lack of collaboration and communication efforts

Established Working Group 3 Research Projects and Activities Priority Timeline

Short-term project / activity pipeline *6 -12 months*	Long-term project / activity pipeline *12 months +*
Conduct conservation / One Health literature review ⇒ Establish parameters ⇒ Conduct literature review ⇒ Quantify interdisciplinary relationships w/ assessment of numbers of publications ⇒ Publish results Establish ecology tool / training aid kits ⇒ Identify and source materials	N/A ⇒ N/A

- ⇒ Collect and build case-control studies for training
- ⇒ Develop training plans
- ⇒ Distribute through BOHRN

Working Group 4: researching human-bat interactions

MISSION: FULLY DEVELOP, UNDERSTAND, AND COMMUNICATE THE BAT AND HUMAN INTERFACE TO KEY STAKEHOLDERS AND COMMUNITIES

Established Working Group 4 Research Focus Areas

Hunting and commodity chain	Human behavioral risk characterization	Interactions in human dwellings	Ecotourism

Objective		Outcomes
Develop and test policy interventions for specific human-bat interfaces	→	Policy interventions for human-bat interfaces are developed and put into place
Communicate key findings to stakeholders	→	Effectively communicate and publish findings of studies
Develop global risk maps to assess existing data and validate risk maps	→	Publish global risk maps highlighting geographic areas of risk
Identify high-risk groups and develop education platforms to measure knowledge, attitude and practices	→	Getting community buy-in and understanding of concepts

Overall Challenges: (1) Truthful responses in behavior research on bat-human interactions; (2) accuracy of risk map and models; (3) cultural barriers and beliefs

Established Working Group 4 Research Projects and Activities Priority Timeline

Short-term project / activity pipeline *6 -12 months*	Long-term project / activity pipeline *12 months +*
⇒ Develop global risk maps ⇒ Survey high-risk groups for their KAP	Conduct research studies / support for ecology ⇒ Develop and validate education platforms ⇒ Research to measure changes in KAP ⇒ Validate ground-truth risk maps

⇒ Adapt education platforms / materials

Recommendations

BOHRN organizers invited many researchers from diverse backgrounds at varying levels of professional experience to the Vienna workshop. This approach facilitated lively discussions and prompted the Steering Committee to consider new objectives, priorities, and perspectives within their previously established Working Group bounds. The following recommendations were captured by note-takers, observers, and other members of the Steering Committee, and will be marked for further discussion and adjudication during BOHRN's next Steering Committee meeting which will be held at International Bat Research Conference (IBRC) in Phuket, Thailand 2019.

Working Group 1: researching host-pathogen biology and interactions

Breakout Session Recommendations: members of the breakout group accepted the overall mission and objectives that Working Group 1 had established and proposed adding two additional research focus areas: (1) the role of bat taxonomy in host-pathogen coevolution and (2) host specificity in bat-borne pathogens. Members of the breakout group also proposed the following additions to the priority timeline:

- ⇒ Establish species identification consensus tools and techniques – such as the role of bar coding and other methods
- ⇒ Host or link to public-facing databases (e.g., Vertnet, National Science Foundation digitized database)
- ⇒ Identify regional resource repositories for voucher materials
- ⇒ Establish sustainable freezer network
- ⇒ Develop funding models for in-country collection curation capacity building / field sample collection transfer (business plans, logistics, maintenance, training)
- ⇒ Establish a database of reagents
- ⇒ Establish a list of international regulatory experts for transport of select agent materials (e.g., Bombali ebolavirus discovery and the issues they had with reporting and transfer)

Working Group 2: researching pathogen surveillance, diagnostic capacity and epidemiology

Breakout Session Recommendations: members of this breakout group generally accepted the mission and objectives that Working Group 2 had established. They proposed amending the research focus area for "Molecular Epidemiology" to include "Molecular and Serological Epidemiology". They also proposed the following additions to the priority timeline:

- ⇒ Establish a set of common research questions and topics related to biosurveillance data-type (syndromic, diagnostic, environmental) associated with bat-borne pathogen threats
- ⇒ Establish a catalog of surveillance models
- ⇒ Develop a sera and antibody collection with a standardized pool of collection
- ⇒ Conduct studies that integrate bat ecology and pathogen research (One Health research team that collects virology and ecological data at the same time)

- ⇒ Establish a list of minimum biosecurity / biosafety protocols for research (lab / field) and recommended sample sets / study
- ⇒ Establish a list of laboratories with bat sample repositories (by region and country
- ⇒ Establish a registry of "Bat Experts" by region and country
- ⇒ Identify diagnostic capabilities (person / institution)
- ⇒ Develop a hypothesis map
- ⇒ Outline funding mechanisms for other BOHRN stakeholders

The breakout group also recommended that any efforts to seek "standardization" (surveillance platforms) should use the phrase "common framework" as methods and implementation will vary in different countries and regions.

Working Group 3: researching ecology (bat, domesticated animals and wildlife interface)

Breakout Sessions Recommendations: during the breakout session, members of this group did not have any substantial modifications to the Working Group's mission, focus areas, or objectives. They did provide several ideas long-term timeline priorities, which included:

- ⇒ Conduct ecological and taxonomic studies that support disease research (and threat reduction), this will create a demand for ecologists to collect samples and will ultimately capacity for ecology through training and networking
- ⇒ Identify ecological and taxonomic gaps at local levels

Since much of Working Group 3's approach was built around the development of training modules, the group discussed training and the importance of tailoring existing projects / programs. They talked about sustainability in bat research programs and mechanisms for incentivization, offering ideas such as scholarships at the end of a short research project or using a training workshop as a research candidate selection opportunity.

Working Group 4: researching human-bat interactions

Breakout Sessions Recommendations: members of this breakout group did not have any major changes to the Working Group's mission, focus areas, or objectives. They did, however, want to emphasize the importance determining *where* human behavioral risks are the highest and *what* drives specific human bat interactions and the need to map these interactions accordingly. With regard to the timeline priorities, they made the following recommendations:

- ⇒ Characterize the risk map with priorities
  - DTRA (BTRP) priority pathogens, USG priority pathogen threats, WHO regional threats
  - Chart recent pandemics with drivers (e.g., bush meat markets overlaid with outbreaks)
- ⇒ For database define the approach to obtain data; Bat Conservation International (example), Bat-Plant.com for ecology interactions

Breakout Session 2 Overview

The first breakout session provided a foundation for the second breakout session during which participants formed into regional teams to craft research projects within the bounds of the BOHRN Working Group research focus areas. BTRP intends to fund several high priority threat reduction projects in FY19-FY20 and developed this exercise to test the viability of the network's strategy thus far. The

projects that were developed will not be summarized in this report, as they may be part of future project proposal; however, the images below show the work, collaboration, and collegial spirit of this session.

Participant Feedback

After the BOHRN Workshop participants were sent an anonymous feedback survey via SurveyMonkey. The participants were asked the following six questions:

1. What did you like about this Workshop?
2. Do you think the objectives for the BOHRN Workshop were achieved? Please explain your answer.
3. What do you wish we did differently?
4. What does success of this network look like to you, for your field of study?
5. What do you think was the most important aspect of this Workshop?
6. Any other comments or suggestions?

Overall, the participants responded positively to the efforts accomplished at the first annual BOHRN Workshop. An appreciation for the multidisciplinary networking opportunities, the potential opportunities the network presents, and the alignment of breakout group work with the Workshop presentations was convey by all participants. One participant's comment reflects this in saying "the multidisciplinary networking opportunities for engaging the ecological context of emerging infectious disease and breakout sessions were a nice complement to the big group discussions." Participant feedback indicated that the BOHRN Workshop objectives were achieved but there was a need for further information on next steps and more opportunity for discussion after the final small group session. Suggestions for change were to extend the workshop for two whole days and provide more focus on funding the discussed research.

BOHRN Path Forward

As a result of this workshop, BTRP intends to release an announcement for research project funding in the early part of 2019. The official announcement will be released on the BOHRN website (www.BOHRN.net) and emailed to anyone who has participated in a BOHRN activity.

At the conclusion of the workshop, Dr. Martha Stokes presented draft criteria for project award consideration, which included:

- Performed in BTRP engagement countries
- Demonstrated commitment to capacity building in BTRP mission areas (biosafety and biosecurity, and biosurveillance)
- Demonstrated commitment to open science
    - Transparent sharing of knowledge and information
    - Should include a data curation plan and broad statement on information access
    - Sample sharing not require, but strongly encouraged and preferred
- Demonstrated commitment to One Health
    - Inter-disciplinary research teams
    - Local engagement plans or educational outreach

- Include early to mid-career project investigators
- Address cross-cutting themes of BOHRN
    - Projects should be tied to no less than two working groups
    - Projects should be tied to no less than one focus area within each working group
- Include mentorship from member of steering committee or a Steering Committee/Executive Committee-approved designee (correlates to respective working group(s))

These factors are still under consideration and BTRP may change any or all. The only information regarding "Criteria for Eligibility" for a BOHRN grant/project award will be released on BOHRN.net. The timeline for award will also be released on BOHRN.net.

Annex 1: Agenda

Day 1

Time	Session	Objectives
0700 – 0800	**Closed-door Steering Committee Meeting**	
0730 – 0810	**Photo Registration (for non-steering committee members)**	
0810 – 0845	**Welcome and Introductions** Marty Stokes *Biological Threat Reduction Program (BTRP)*	Welcome all participants, provide four slides about BTRP and TRNs All participants go around the room and introduce name and organization
0845 – 0900	**BOHRN Overview** Marty Stokes *Biological Threat Reduction Program (BTRP)*	Provide an overview about BOHRN, its mission and objectives; make sure to discuss (1) the funding opportunity; (2) the principles of capacity building / mentorship
0900 – 0910	**BOHRN Workshop Agenda, Objectives, and Housekeeping** Katie Leahy *Global Systems Engineering*	Provide overview of meeting objectives, scheme of maneuver, and other housekeeping items
Session 1: BOHRN Focus Group Progress and Work		
0910 – 0930	**Understanding the Ecology of Viruses** Jon Epstein *EcoHealth Alliance*	Discuss the challenges and understanding of the ecology of viruses such as Nipah and Ebola
0930 – 0950	**Host/Pathogen Interaction** Jon Towner *CDC- Division of High-Consequence Pathogens and Pathology*	Present on work focusing on viruses in the national reservoir hosts and determine the mechanisms by which the viruses are maintained in nature
0950 – 1010	**Laboratory Response** Brian Bird *UC Davis, School of Veterinary Medicine*	Synergies between the Bench and the Field: Rift Valley Fever and Ebola
1010 – 1030	**Building Policy and Community Outreach Initiatives Based on a Novel Understanding of Who, What, and Why** Susan Tsang *American Museum of Natural History and National Museum of the Philippines*	Discuss efforts to bridge policy gaps between local, national, regional, and international efforts
1030 – 1110	**Focus Area Research Mentor Progress Reports**	A representative or mentor from each group will present their Focus Area

		objectives, its long / short-term goals schedule, and progress Group 1: 10 min Group 2: 10 min Group 3: 10 min Group 4: 10 min
1110 – 1215	**Breakout Groups**	Participants will be broken into the focus area groups; their placement will be pre-arranged by decision of the steering committee and they will have a sticker on the back of their name card; they will be asked to listen in on the focus area group discussion, see if they could contribute to the group's direction
1215 – 1320	**Working Lunch**	
1320 – 1400	**Breakout Group Open Discussion**	Each group will present any changes to their schedules or objectives Group 1: 10 min Group 2: 10 min Group 3: 10 min Group 4: 10 min
Session 2: BOHRN Project Development Work		
1400 – 1430	**Doing Business with BTRP: Pathways to Contracts, Objectives for BOHRN and Beyond** Dr. Martha Stokes *BTRP*	20 Minute presentation of slides that Lance gave in Georgia, plus 1-2 developed with Scott V., plus 10 minutes for questions from the audience; this presentation will queue funding project development for focus area-specific RFPs
1430 – 1600	**Interactive Illustration Hypothesis Mapping Exercise**	Dr. Kingston and Dr. Epstein will facilitate an interactive hypothesis mapping session for the group
1600 – 1715	**Breakout Groups**	Breakout into blended project development groups. These groups will be based on seating arrangement (e.g., tables 1 and 2 will work together) to ensure that we have multi-disciplinary efforts.
1715 – 1730	**Close-out Day 1 and Review Day 2**	
1830 – 2000	**Dinner / Social Event** **Quad Chart / Poster Presentations**	

Day 2

Time	Session	Objectives
0900 – 1130	**Small Group Project Development Work**	Groups will come back to the main room to continue work in the smaller group project development
1000 – 1030	**Working Tea Break**	
1130 – 1300	**Working Lunch Break / Small Group Brief-outs**	
1300 – 1315	**Close-out / Group Discussion**	
TBD	**Steering Committee Meeting**	

Annex 2: Participant list

Name	Country	Organization
Abel Wade	Cameroon	National Veterinary Laboratory, Cameroon
Wanda Markotter	South Africa	University of Pretoria, Dept of Microbiology and Plant Pathology
Benneth Obitte	Nigeria	Texas Tech University
Iroro Tanshi	Nigeria	Texas Tech University
Joram Buza	Tanzania	Nelson Mandela African Institute of Science and Technology
Robert Kityo	Uganda	Makerere University, Kampala
Julian Lutwama	Uganda	Uganda Virus Research Institute
Astghik Ghazaryn	Armenia	Yerevan State University
Ioseb Natradze	Georgia	Ilia State University
Keti Sidamonideze	Georgia	National Center for Disease Control and Public Health -Georgia
Lela Urushadze	Georgia	National Center for Disease Control and Public Health - Georgia
Nesreen Alhmoud	Jordan	Royal Scientific Society
Meryem Lemrani	Jordan	Pasteur Institute in Morocco
Ehab Abu-Basha	Jordan	Jordan University of Science and Technology
Shusmita Dutta	Bangladesh	University of North Bengal
Ariful Islam	Bangladesh	EcoHealth Alliance
Shahanaj Shano	Bangladesh	Jahangirnagar Univeristy
Pilot Dovih	India	National Centre for Biological Sciences
Juliana Senawi	Malaysia	University of Kebangsaan Malaysia
Philip Alviola	Philippines	University of the Philippines-Los Banos
Catalino Demetria	Philippines	Research Institute for Tropical Medicine
Benjamin Lee	Singapore	Duke-NUS, Singapore
Sara Bumrungsri	Thailand	Prince of Songkla University
Pipat Soisook	Thailand	Princess Maha Chakri Sirindhorn Natural History Museum
Supaporn Wacharapluesadee	Thailand	WHO CC for Research and Training in Viral Zoonoses, King Chulalongkorn Memorial Hospital, Thailand
Vu Dinh Thong	Vietnam	Institute of Ecology and Biological Resources
Patrick Ayscue	United States	Metabiota
Brian Bird	United States	University of California- Davis
Bradford Brooks	United States	Metabiota
Jon Epstein	United States	EcoHealth Alliance
Jason Farlow	United States	Metabiotia
Tracey Goldstein	United States	University of California- Davis
Andreas Handel	United States	University of Georgia

Rebekah Kading	United States	Colorado State University
Tigga Kingston	United States	Texas Tech University
Eric Laing	United States	Uniformed Services Health Service University
Kendra Phelps	United States	EcoHealth Alliance
Mariano Sanchez-Lockhart	United States	United States Army Medical Research Institute for Infectious Diseases - Genomic Center
Jonathan Towner	United States	Center for Disease Control and Prevention, Viral Special Pathogens Branch
Susan Tsang	United States	Royal Scientific Society
Marty Stokes	United States	DTRA Biological Threat Reduction Program
Steve Becker	United States	DTRA A&AS
Katie Leahy	United States	Global Systems Engineering
Chris Russell	United States	Global Systems Engineering
Jason Hudson	United States	Global Systems Engineering

Subject: BOHRN and OHC Invitation
Attachment(s): "BOHRNFactSheet.pdf","JKO SERE ATFP ISOPREP Instructions NOV 2016[1].doc"

All,

You are receiving this email, as part of a formal invitation to attend our BOHRN Steering Committee meeting and the 5th International One Health Congress (OHC) in Saskatoon, Canada. We understand you are very busy people, so please feel free to attend all or portions of the Conference. The OHC 2018 Provisional Conference Schedule can be found here. As previously emailed, CBEP will be doing one conference registration for all those who can attend some or all of the conference. The conference dates for both events will span 20-25 June 18.

Our meeting will take place 20-21 June (location TBD, though likely at the Hilton Garden Inn). Attached is the updated fact sheet, the agenda will follow shortly.

On behalf of Dr. Marty Stoke and Dr. Mary Lancaster, CBEP will be funding your travel and registration to the BOHRN and OHC. Specific instructions may be found below my signature block. Please let us know what portions of the week you will be able to attend. We will need to know what days of the conferences you will be able to attend for hotel room blocks and registration.

We very much hope you will be able to attend our meeting and some or all of the conference thereafter. Please let me know your plans and begin communication with Nicki at your earliest convenience. If you are only planning to stay for part of the OHC, please indicate the dates you will be attending when coordinating your travel.

V/r,

Megan Hudson

Travel instructions:
Please contact Nicki Aleman NLT **9 April 2018** if you intend to travel; you will likely need to provide her with your passport information, to and from destinations, and travel dates. CBEP's logistics support coordinators will work with you to secure plane reservations. Please note that they try to work with your preferences, but must remain within the boundaries of the Department of Defense regulations for travel. *If your trainings are not completed by the assigned date, funding for travel and conference registration will not be provided.*

B O H R N

The Bat / One Health Research Network

Overview

There is a long tradition of international cooperation in scientific research. Scientific networks can be instrumental to bridge cultural boundaries and build trust, addressing the global threat of emerging infectious diseases. Current trends in scientific research funding, specifically competition for ever-decreasing research budgets, necessitate international collaborations focused around specific and prioritized research questions.

Scientists posit that the Ebola outbreak of 2014 began with a Guinean toddler playing in a bat roost amongst fruit bats that had migrated 2,500 miles from Central Africa. Understanding bat migration patterns, the effect of humans on those patterns, and the challenges of conducting disease surveillance in free-range bat populations, will enable relevant policy makers to better identify, plan, and prepare for the next pandemic. Additionally, research coordinated networks have the ability to significantly impact threat reduction by identifying and prioritizing coordinated approaches to close these and other pressing knowledge gaps.

The Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) is sponsoring a multi-regional disease surveillance research coordinated network to mitigate the threat of bat-associated pathogens of security concern. This network will identify and connect interdisciplinary expertise, convening an agile group to adapt to a wide spectrum of arising challenges and threats. The Bat / One Health Research Network (BOHRN) will enable shared learning and research opportunities, establish new research projects, and facilitate joint applications for funding; thus increasing the opportunity for peer review, especially if a cross-regional and multi-disciplinary team of authors is involved

The BOHRN kick-off meeting coincided with the 2nd International Symposium on Infectious Diseases of Bats in Fort Collins, CO on 29 June 2017. During this meeting, the group began preliminary actions to build a self-sustainable disease surveillance network and identified initial network objectives needed to develop a comprehensive research strategy to address bat-associated disease threats and mitigation solutions.

Network Objectives

- Facilitate interdisciplinary collaboration to identify research goals and needs for bat-borne disease research and broader threat reduction
- Create a common action plan that yields collaborative and sustainable projects which: (1) better inform policy makers; (2) better inform scientific community regarding funding targets and gaps in areas of research and development; (3) better define threat to global health security from bat-associated pathogens; and (4) improve national, regional, and global capacity to detect and respond to pathogens of security concern
- Enable better communication, coordination, and outreach at the research and conservation interface

Approach and Impact

BOHRN has four thematic focus areas, which were characterized and developed into research Working Groups at the kick-off meeting. These Working Groups (described below) will operationalize the network objectives by serving as subdivisions to the overall network to foster multi-national and multidisciplinary participation and mentorship. Each member of the BOHRN will identify with at least one Working Group based on field of research/practice. Working Group members will identify and prioritize research gaps and needs, and research project ideas will be solicited from BOHRN membership to address the identified gaps and needs.

Working Group 1: Host / pathogen biology interactions; specifically: (1) Bat physiology and immunology; (2) Bat pathogen community biology (e.g., co-infections and co-morbidities); and (3) Distribution of pathogens among species

Working Group 2: Pathogen surveillance, diagnostic capacity, and epidemiology; specifically: (1) Molecular epidemiology; (2) Distribution of pathogens geographically and phylogenetically; and (3) Detection, diagnosis, and reporting of bat-associated pathogens

Working Group 3: Ecology (bat, domesticated animal, and wildlife interface); specifically: (1) Bat behavior; (2) Domesticated animal and wildlife behavior, distribution, and movement impact; and (3) The effect of anthropogenic disturbance and modification on pathogen dynamics and spillover risks

Working Group 4: Human-bat interactions; specifically: (1) Hunting and commodity chain (e.g., bushmeat, guano, and pet trade); (2) Ecotourism; and (3) Interactions in human dwellings

Why Bats?

Bats act as natural reservoirs for over 60 pathogens, including some of the world's most deadly viruses, such as Nipah, Hendra, Marburg, and SARS viruses. Understanding the role of bats as a reservoir and the risk of pathogen transmission from bats to humans and other animals could be a key to discovering novel pathogens, mitigating the impact of emerging and re-emerging pathogens, and preventing future pandemics.

There are a number of factors which make bats unique disease reservoirs, including their social behavior, distinct physiology and metabolism, ability to travel long distances, nocturnal activity, species diversity, and long life span (10-20 years). These specific bat characteristics, coupled with the impact of human-mediated interactions and environmental changes, create research challenges to understanding the role of bats in global zoonotic disease ecology. BOHRN w ill create opportunities for policy makers, scientists, conservationists, funders, and students to identify community challenges, develop priority research lists and implement associated action plans that target needs and gaps. The opportunities created will work at all levels to build awareness of bat-associated disease burden and transmission risks and improve the prevention, detection, diagnosis, and reporting of pathogens of security concern.

U.S. DoD and Health Security

BOHRN outcomes will also support the Global Health Security Agenda (GHSA) Zoonotic Disease Action Package, which has a five-year target for countries to adopt measured behaviors, policies, and/or practices that minimize the spillover of zoonotic diseases from lower animals into human populations.

Although not directly involved in implementation, DTRA CBEP supports the GHSA goals and milestones, and synchronizes with GHSA country projects through the DoD GHSA Coordination Cell. DTRA CBEP is the DoD' premier biological nonproliferation division protecting the United States and its allies from especially dangerous pathogens by collaborating with partner countries and the international community to minimize the threat of deliberate, accidental, and natural infectious disease outbreaks through enhanced biosafety, security, and surveillance measures. DTRA CBEP investments build capacity to detect, diagnose, and report disease events and help reduce the magnitude and response costs of biological incidents.

Additionally, DTRA CBEP promotes scientific and technical collaborations among partner nations and the international community in the disciplines of biological safety, security, and surveillance to build constructive and sustainable international partnerships that address threats posed to health security. These science diplomacy-based activities engage scientists in peaceful application of biotechnology; building partner country disease surveillance capabilities; promoting adherence to international codes of conduct, security, and safety; and enhancing transparency and confidence building.

Although DTRA CBEP is committed to supporting BOHRN, there is no guarantee or obligation for DTRA CBEP to fund projects resulting from the network or its members.

JKO – SERE 100 – ATFP – ISOPREP Completion Instructions

- These instructions are for Civilians and Contractors without a Common Access Card (CAC).
- When emailing, use your Work Email address. - Training is not required by Foreign Nationals.

1. JKO Course # JS-US007: Level I Antiterrorism Awareness Training: Valid for 12 Months.
Training can be accessed via link below. You do not need a JKO account to access training.
Click link below. When site opens up, click OK to close DOD Security Banner after reading.
Click on Non-CAC users under JS-007 Level I Antiterrorism Awareness Training, and follow instructions.
https://jkodirect.jten.mil/Atlas2/faces/page/login/Login.seam

2. JKO Course J3TA-US1329, SERE 100.2 Level A SERE Education and Training in Support of the Code of Conduct (FOUO): Valid for 36 Months or AS REQUIRED BY THE FOREIGN CLEARANCE GUIDE. FREQUENCY SUBJECT TO CHANGE.
To complete SERE training follow these instructions. Click on the following link. http://jko.jten.mil/index.html on the page that opens up, click on enter JKO. Read the Security Banner then click OK to close. On the page you are viewing now, under **I DO NOT have a CaC, select Non-Government Personnel/Sponsored Account Registration.**
On the next page, fill out the requested information. In the Reason for Account, after you enter reason, add the CBEP Country Manager and Country you are supporting. Not providing this information will cause delays. Then click submit. My email is John.T.Patterson2.civ@mail.mil.
When you click submit it will send a notice to me. I will verify reason with Country manager and submit request. The JKO office will contact you with your logon information. Once you have obtained your log on information, return to https://jkodirect.jten.mil/Atlas2/faces/page/login/Login.seam to log into JKO. Once logged in, select the Catalog Tab at top of page and enter "SERE" in title/keyword box, and click search. SERE 100.2 Level A SERE Education and Training in Support of the Code of Conduct (FOUO) - (4 hrs) should be listed. Click enroll to access course.
If you get an out of office notice from me, you will have to resubmit your request using the CBEP Country Manager's email address that you are supporting, they can sponsor you. You may want to check before submitting request.

Contact JKO at JKOHelpDesk@jten.mil or 757-203-5654 for access issues.

DO NOT send form by email or regular mail. Once blocks 50-54 are completed the form is classified CONFIDENTIAL. And must be sent using shipping instructions on page 2

3. DD Form 1833 Isolated Personnel Report (ISOPREP): Valid 12 Months or AS REQUIRED BY THE FOREIGN CLEARANCE GUIDE. FREQUENCY SUBJECT TO CHANGE.

If you have a DOD CAC, click on link below and follow instructions to complete your **initial ISOPREP**. You must be on a .mil or .gov domain computer system.
https://prmsglobal.prms.af.mil/prmsconv/Profile/Survey/start.aspx

If you need to update or want to verify your ISOPREP, contact one of individuals listed below.

If you are in the local area, you may contact John.T.Patterson2.civ@mail.mil / 703-767-5938 to arrange completion of your ISOPREP at the CTR office. If you receive an out of office response, you may contact theodore.w.carlson.civ@mail.mil / 703-767-6382 for assistance. Use these same contacts for updates.

If you do not have a DOD CAC, and are not in the local area, fill out DD Form 1833. This can be found by searching online. Instructions are included in form. Finger prints are not required. Section 9 blocks 50-54 should be typed on separate piece of paper and included with the form. Once completed, form is classified as Confidential and must be sent following instructions on page 2. Your SSN is needed. You Blood type is needed. Your DOB is needed. Make sure to follow the instructions for the 4 Statements and the Authentication Number.

Submit two photos, a front view and right side profile view, from the shoulders up. Photos may be sent with the form or the preferred method is to email the photos only to John.T.Patterson2.civ@mail.mil

DO NOT send form by email or regular mail. Once blocks 50-54 are completed the form is classified CONFIDENTIAL. Send using instructions below

Mailing Instructions

Seal package with type of tape to retain postal stamp impressions. Prepare, package, and securely seal classified material in ways to MAXIMIZE evidence of tampering and MINIMIZE undetected deliberate compromise, or risk of accidental exposure. To minimize the risk of exposure of classified information, package documents so that classified material is not in direct contact with the inner envelope or container (e.g., fold so classified material faces together).
Double wrap classified information in two opaque, sealed envelopes, wrappings, or containers, durable enough to properly protect the material from accidental exposure and facilitate detection of tampering.
Do not place classification marking or any other unusual marks on the outer package that might invite special attention to the fact that the contents are classified

After completing form, fold so classified information faces together. Place folded form, disk or photos if you did not email them inside fully addressed and marked package as instructed and shown below.

Form	Inner Package	Outer Package
CONF IDEN TIAL	Full Name CONFIDENTIAL Full Address (Mark Front and Back) ATTN: J3CTB/John Patterson and CTR	Office Name Only Office Address See proper address

Inner Package:

Mark inner package as shown above. Be sure to replace the CTR CBEP Country Managers' name shown with the actual name you are supporting.

- Complete recipients and sender address
- Mark top/bottom and front/ back with CONFIDENTIAL markings.
- Seal package as stated at top of this page.

Place this package inside of another package (outer package).

Outer Package:

Mark outer package as shown above.

- Use only office name and office address. Do not use individual names.
- Do not use markings of any kind indicating classification or that the package contains classified material.
- Seal package as stated at top of this page.
- Send package via USPS, FEDEX, UPS, DHL, etc. Make sure you have a tracking # for Package.
- After sending package notify John.T.Patterson2.civ@mail.mil, and applicable CTR CBEP Country Manager so we are aware to be watching for package.

Use correct address below depending on shipper. Make sure you have a tracking number for your package.

For Registered / Express mail via the US Postal Service	**For Express mail via Federal Express, DHL, UPS**

Subject: BOHRN Meeting Survey

All,

We hope you enjoyed the BOHRN meeting and IOHC. As a follow up to the meeting we have a short survey for you to complete. Your feedback is imperative for moving forward and coordinating the next steps for the TRN. Therefore, if you could please complete the survey NLT Monday, 9 July.

Thank you again for your hard work and participation.

Attachment(s): "JKO SERE ATFP ISOPREP Instructions NOV 2016.doc","ITO_Information.docx","IMED_BOHRN Concept Note.docx","WG_ProgressChart.docx"

All,

On behalf of Dr. Marty Stokes you are receiving this email, as part of a save the date to attend our BOHRN Steering Committee meeting and International Meeting on Emerging Diseases and Surveillance (IMED) 8 – 12 November 2018 in Vienna, Austria.

Our meeting will take place on 8 – 9 November (hotel/meeting location TBD). The BOHRN steering committee meeting will aim to meet the objectives the group identified in Saskatoon. The following objectives were suggested based on your survey responses:

1. Prioritizes funding needs based on working groups' characterization of gaps and needs, to help organize and develop funding initiatives; and
2. Analyze progress of action plans and their yields establishing collaborate and sustainable projects

To facilitate these objectives, we will be asking each working group to present their progress. The progress updates for each working group are imperative to the outcomes for this meeting.

As discussed during the June BOHRN meeting, an objective of this meeting is to develop our outreach and populate working groups. Please send any nominations of subject matter experts or other participants who would be beneficial to this discussion **no later than 10 September 2018**.

IMED will take place 9 – 12 November at the Hilton Vienna. The 2018 IMED will focus on innovation and changes in political and societal responses to outbreaks. The theme of IMED aligns with our overall BOHRN objectives and we encourage all BOHRN members to stay and participant in the conference. **Therefore, we need you to confirm your attendance to BOHRN and IMED NLT 14 September.**

v/r,

Megan

Travel instructions:
Please contact Nicki Aleman **NLT 14 September 2018** if you intend to travel; you will likely need to provide her with your passport information, to and from destinations, and travel dates. CBEP's logistics support coordinators will work with you to secure plane reservations. Please note that they try to work with your preferences, but must remain within the boundaries of the Department of Defense regulations for travel.

BOHRN Background

In 2013, CBEP began leveraging, enhancing, and convening TRNs to accelerate its programmatic targets and end states. CBEP employs this approach as a way to connect its active funded research projects with other projects to improve global health security, building consistency in data sets, and facilitate more confident decision-making by policy makers. Relationship-based networks around the globe, made up of interdisciplinary researchers, allow for novel and transformative scientific solutions for the world's high-impact infectious disease threats.

BOHRN connects multidisciplinary and One Health expertise to address research-based capability gaps and threats posed by bat-associated pathogens of security concern. The group maintains the standards of all research networks that are supported by CBEP, in which members convene as a body of experts and researchers to: (1) share information, data, samples, and protocols; (2) coordinate research activities; (3) build training events and awareness-building workshops at all levels of decision-making authority; (4) develop community standards and best research practices; (5) create mentorship-based opportunities for students, trainees, and early-career researchers to convene, present, and share ideas; (6) establish a community of international research leaders and champions; and (7) reduce outbreak and disease transmission risks.

Why Bats?

Scientists hypothesize that some of the world's most deadly emerging zoonotic diseases are found in bats, including Nipah, Hendra, and Marburg viruses. However, because bats contribute significantly to the health and diversity of many environments around the world, a conservation-minded approach to their study is necessary. There are a number of factors which could make bats unique disease reservoirs, including their social behavior, distinct physiology and metabolism, ability to travel long distances, nocturnal activity, species diversity, and long life span (10-20 years, compared with a rat's average life of two years).[1] These special bat characteristics, coupled with the impact of human-mediated interactions and environmental changes, create research challenges to understanding the bat's role in the global zoonotic disease ecology, which is further complicated by being difficult animals to study within a typical laboratory setting.

BOHRN is a global network of conservationists, disease ecologists, and clinical virologists who have organized to better understand how bat-borne disease threats filter through ecological systems. BOHRN creates opportunities for policy makers, researchers, conservationists, funders, and students to identify community challenges, develop priority research lists and associated action plans that target needs and gaps, and work at all levels to build awareness of bat-associated disease burden and transmission risks to improve the prevention, detection, diagnosis, and reporting of pathogens of security concern.[2] This group, under sponsorship from CBEP, has established objectives to collaborate on multi-disciplinary research and establish standards for lab and field research practices.

BOHRN Mission and Vision

BOHRN convenes multi-disciplinary and One Health-focused scientists, policy makers, research scientists, and medical/veterinary practitioners with interests in bat-related research involving pathogens of security concern. The network builds on community standards and best practices for research. BOHRN identifies and shares information on research funding opportunities offered by multiple institutions. Most importantly, this network fosters international relationships among collaborators, agencies, and organizations, which can produce long-term, sustainable partnerships that withstand changes in government and organization budgets, priorities, postures, and policies.

All members play a role in operationalizing the objectives of BOHRN, strengthening linkages and reducing overlap in global research on high-priority pathogens of bats (especially zoonosis) to maximize

the efficient use of expertise and resources and accelerate the coordinated development of better disease surveillance and control methods.

BOHRN Objectives

This network will identify and connect interdisciplinary expertise, convening an agile group to adapt to a wide spectrum of emerging challenges and threats. By accomplishing the below objectives BOHRN will enable shared learning and research opportunities, establish new research projects, and facilitate joint applications for funding; thus, increasing the opportunity for peer review, especially if a cross-regional and multi-disciplinary team of authors is involved.

- Facilitate interdisciplinary relationships and collaboration to identify research goals and needs for bat-associated disease research and threat reduction; and
- Unify CBEP regions to create a common action plan that yields collaborative and sustainable projects that achieve the following end states:
    - Better informed policy-makers;
    - Better informed scientific community regarding funding targets and gaps in areas of research and development;
    - Better defined threat to global health security from bat-associated pathogens; and
    - Improved national, regional, and global capacity to detect and respond to pathogens of security concern; and
- Enable better communication, coordination, and outreach at the research and conservation interface.

BOHRN – International Meeting on Emerging Diseases and Surveillance

During the BOHRN meeting, the steering committee voted on options for the next full BOHRN meeting. Several conferences in October – December 2018 were suggested. The group decided that the objectives for the International Meeting on Emerging Diseases and Surveillance (IMED) best met the overall goals of BOHRN. IMED is organized by the International Society for Infectious Diseases and will take place in Vienna, Austria from 9 – 12 November 2018. The conference draft agenda reviews the following objectives: methods and models of disease surveillance, detection and prediction, lessons from epidemic emerging zoonoses, animal health threats biosecurity, agents of bioterrorism and biological warfare infections, and migration of human and animal vector borne diseases. The meeting aims to unite human, veterinary, and environmental specialists on approaches to pathogens in a broad ecological context. These goals align directly to the BOHRN objectives and provide opportunities for the steering committee to socialize the network while gaining tools and information from the interdisciplinary collaboration to aid in accomplishing the working group actions

The BORHN steering committee agreed upon a two-day meeting on 8-9 November to coincide with IMED. The following objectives are suggested:

1. Prioritizes funding needs based on working groups' characterization of gaps and needs, to help organize and develop funding initiatives; and
2. Analyze progress of action plans and their yields establishing collaborate and sustainable projects

The following items are topics for discussion during this meeting:

- Draft initial Request for Approvals
- Develop initiatives for a funding discussion
- Review and begin developing abstracts for working group actions
- Discuss literature review scoping
- Plan and draft agenda for Uganda Training Event
- Read out from Georgia Biological Threat Characterization Discussion (BTCD)
- Identify and catalog existing tool kits for website database
- Develop an approach to outreach and populating working groups
- Report out of working group progress
- Strategy session for future International bat meeting and conferences

Proposed Agenda

Day 1 – 8 November 2018 (Thursday)

- 1000 – 1045 Welcoming Remarks
- 1045 – 1100 House Keeping and Admin
- 1100 – 1130 Updates on BOHRN BTCD
- 1130 – 1145 Working Break
- 1145 – 1300 Updates on Breakout Group Progress
- 1300 – 1400 Lunch
- 1400 – 1600 Breakout Sessions
- 1500 – 1530 Working Break
- 1600 – 1630 Brief-out of Breakout Sessions
- 1630 – 1645 Close-out Discussion

Day 2 – 9 November 2018 (Friday)

- 0900 – 1000 Review of Day 1
- 1000 – 1030 Large Group Discussion – BOHRN Funding
- 1030 – 1045 Working Break
- 1045 – 1145 Breakout Session
- 1145 – 1215 Lunch
- 1215 – 1345 Uganda Training Event
- 1345 – 1415 Large Group Discussion – Future Training Events
- 1415 – 1430 Working Break
- 1430 – 1500 Build Next Meeting Agenda
- 1500 – 1600 Next Steps

Breakout Group Timeline

During the June 2018 One Health Congress and BOHRN meeting in Saskatoon, Canada, meeting attendees “broke out” into four working groups. They were instructed to continue work on the objectives and goals set at previous meetings, creating workplans short and long-term intentions. Due to scheduling issues, all of the working groups were not fully represented, so other members were asked to fill-in for different groups. The following write-up describes the outcomes from the breakout group session. Progress updates from each group will be presented during the November IMED Meeting.

Group 1: Host-Pathogen Biology and Interactions

Group 1: Host-Pathogen Biology and Interactions **Focus Area 1:** Bat physiology and immunology **Focus Area 2:** Bat pathogen community biology (e.g., coinfections and comorbidities) **Focus Area 3:** Distribution of pathogens amongst species **Focus Area 4:** Develop modeling approaches for host dynamics and epidemiology	
MISSION STATEMENT: Explain the determinants of tolerance, transmission, and spillover of pathogens by bats at individual and population levels.	
Objective 1	Complete a systematic review of the knowledge gaps on modeling systems
Objective 2	Identify model systems that are representative of all geographic and phylogenic areas
Objective 3	Evaluate the transmission risk and spillover of pathogens to other animal hosts
Projects or Activities	**Timeline / Responsible Authority / Needs (e.g., funding or other support**
Develop cell lines and bat animal models	Long-term lab study
IgM immunoassay	Long-term lab study
Develop methods for determining the age of bats	Long-term lab/field study
Determine the timing of viral shedding and the effects of environmental stresses	Long-term lab/field study
Determine co-infection in bat species	Long-term lab/field study
Determine temperate versus tropical variables associated with infection (hibernation periods / viral replication)	Long-term lab/field study; study species that live in both temperate and tropical locations; study climate change
Understand climate change in respect to physiology	Long-term lab/field study; study species that live in both temperate and tropical locations; study climate change
Map funding landscape / reach out to program officers from agencies	Short-term project (within 6-months) to map funders Long-term project (within 1-year) to host a funders meeting

	Need to identify funders with different interests in the same biological/ecological system to provide long-term funding
Develop heat stable preservatives	Long-term lab/field study
Develop smaller telemetry and physiology sensors	Long-term lab/field study

Group Notes

Group 1 discussed ways the need to mine existing studies for data, which could extend the longevity of data collection and the breadth of data sets. They additionally requested a funders' meeting to identify other program officers and tech companies that would be interested in BOHRN research projects. The group suggested providing opportunities for training, which could include EDGE at Los Alamos National Laboratory for bioinformatics and next generation sequencing. The group discussed the need to identify funders with different interest in the same biological/ecological system that can provide more longer-term funding and to also engage with biologists from regions that have expertise on bat ecology and history.

Group Research Mentors

Dr. Mary Lancaster, DTRA CBEP

Dr. Jon Epstein (EcoHealth Alliance) *– note: ordinarily works Group 2*

Dr. Lela Urushadze (NCDC, Georgia) *– note: ordinarily works Group 4*

Dr. Joram Buza (Nelson Mandela-African Institute of S&T, Tanzania) *– note: invited, could not attend*

Dr. Gavin Smith (Duke NUS Medical School, Singapore) *– note: invited, could not attend*

Group 2: Pathogen Surveillance, Diagnostic Capactiy, and Epidemiology

Group 2: Pathogen Surveillance, Diagnostic Capacity, and Epidemiology **Focus Area 1:** Molecular epidemiology **Focus Area 2:** Distribution of pathogens geographically and phylogenetically **Focus Area 3:** Detection, diagnosis, and reporting of bat-associated pathogens **Focus Area 4:** Establish commonly used guidance on sampling	
MISSION STATEMENT: Form regional networks to establish a common methodology for surveillance and sustain the surveillance for both human and animal health. In addition to understanding spillover risk and epidemiology of bats	
Objective 1	Fully establish a baseline of animal health and public health laboratories for equipment, staff, and diagnostic tools
Objective 2	Build awareness amongst the research, public health, and other science communities
Objective 3	Establish a common methodology for surveillance
Projects or Activities	**Timeline / Responsible Authority / Needs (e.g., funding or other support)**
Develop assessment tool and conduct capability assessments in laboratories to establish baseline requirements for conducting NGS and other diagnostic protocols for detecting novel and routine diseases from bats	Timeline: Immediate: identify laboratories to assess (likely National Reference Labs, Ministries or Departments of Public (human) and Animal Health) 1-9 Months: create, distribute, and receive feedback questionnaires from labs 9-12 Months: conduct lab visits (as necessary) to identify inconsistencies and fill in knowledge gaps 12-18 Months: assess data, send feedback to labs, and publish report on findings Needs: Technical support and funding
Conduct outreach through meetings with multisectoral stakeholders and social media	Timeline: Immediate: identify opportunities for side meetings at larger animal and public health events with topics related to diagnostic surveillance; identify POCs to serve on One Health committees 6 Months: present research findings and publications; form country-specific One Health committees to sustain awareness and serve as organizers for regional meetings (e.g., 2-3 Animal and Public Health researchers / university) 12 Months: form outreach teams that can network through social media, perform website updates, and survey additional information from other networks and associations Needs:

	Identify potential funders for logistics and planning support; need technical support for social media, web design, and communications
Establish a common methodology for diagnostic surveillance	Timeline: Long-term, after completion of needs assessment tool and implementation 2+ years to implement Needs: Funding for equipment and technical training; resources to develop EQA

Group Notes

Group 2 worked to emphasize the need for commonality (technique, tools, communication, and lexicon) and communication. They worked to offer a plan that identifies baseline tools for lab-based disease surveillance and sets up a system of multi-sectoral outreach and communication.

Group Research Mentors

Dr. Catalino Demetria (Research Institute for Tropical Medicine, Philippines)

Dr. Tamar Kutateladze (NCDC, Georgia)

Dr. Jon Epstein (EcoHealth Alliance) *– note: worked in Group 1*

Dr. Abel Wade (National Veterinary Laboratory, Cameroon) *– note: invited, could not attend*

Dr. Keti Sidamonidze (NCDC, Georgia) *– note: worked in Group 3*

Group 3: Ecology Setting (Bat, Domesticated Animals, and Wildlife Interface)

Group 3: Ecology Setting (Bat, Domesticated Animals, and Wildlife Interface) **Focus Area 1:** Bat behavior, distribution, and movement **Focus Area 2:** Domesticated animals and wildlife behavior, distribution, and movement and impact on interaction with bats **Focus Area 3:** Effect of anthropogenic disturbance and modification on pathogen dynamics and spillover risk	
MISSION STATEMENT: Define how and to what extent the ecological context of bats, and human influence on that context influence pathogen dynamics and spillover threats.	
Objective 1	Improve coordination at the One Health / conservation interface
Objective 2	Define ecological principles that could inform spillover threats
Objective 3	Conduct conservation-minded messaging and outreach
Projects or Activities	**Timeline / Responsible Authority /** **Needs (e.g., funding or other support)**
Quantify interdisciplinary relationship through assessment of publications that feature animal and/or public health, zoonotic disease focus and awareness	Timeline: 6-months post-identification of search parameters Needs: Require BOHRN help in defining search parameters (set as agenda item for next meeting) Research and lit review assistance
Define lit review search parameters for study	Timeline: 6-months Needs: Identify target journals for publication; research guidelines for conducting and publishing a lit review
Publish position paper advocating for improved relationships amongst conservation and One Health communities and suggesting collaborative research projects as a way to bridge differences	Timeline: 1-year (NLT summer 2019) Needs: Research assistance
Develop a repository of tool kits, safety and research guidelines for protecting human and bat health; publish available materials on the BOHRN website	Timeline: 6-months to collect information into training guides for use at field workshops

	Needs: Research assistance; meeting support
Conduct tactical field training activities and a “train the trainer” model	Timeline: 6-months (next BOHRN meeting) establish goals and objectives 9-months establish first training event (Uganda) Needs: Planning / funding / logistics support Funding support for implementation
Build case-control studies for training purposes in messaging	Timeline: 6-months for use during training events Needs: BOHRN group support for case-control study ideas
Participate in One Health / conservation conference panels	Timeline: International Bat Research Conference (IBRC) June 2019 Needs: Participation from BOHRN

Group Notes

Group 3 focused on engaging the ecological community and analyzing frameworks for pathogen research through assessing One Health interactions and developing workplans to include conferences for outreach. Their workplan offers the ability to establish key messages throughout the ecological community.

Group Research Mentors

Dr. Rebekah Kading (Colorado State University)

Dr. Keti Sidamonidze (NCDC, Georgia) *– note: ordinarily works in Group 2*

Dr. Paul Cryan (USGS Fort Collins Science Center) *– note: invited, could not attend*

Dr. Tigga Kingston (Texas Tech University) *– note: invited, could not attend*

Dr. Robert Kityo (Makerere University, Uganda) *– note: invited, could not attend*

Group 4: Human-Bat Interactions

Group 4: Human-Bat Interactions	
Focus Area 1: Human behavioral risk characterization **Focus Area 2:** Hunting and commodity chain (e.g. bushmeat, guano, and pet trade) **Focus Area 3:** Ecotourism **Focus Area 4:** Interactions in human dwellings	
MISSION STATEMENT: Characterize relationships and interactions between bats and humans and communicate findings to key stakeholders and communities.	
Objective 1	Identify and characterize high-risk interfaces
Objective 2	Develop risk maps to assess existing data and validate risks
Objective 3	Communicate findings to key stakeholders
Objective 4	Develop and test policy interventions for specific human bat interfaces
Projects or Activities	**Timeline / Responsible Authority / Needs (e.g., funding or other support)**
Convene a series of funders' meetings	Timeline: 12 months Needs: Assessment of available funders and timeline of BOHRN projects needing funding Funding platform on BOHRN website
Conduct survey that identifies risk groups and interfaces	Timeline: 12 months Needs: Literature assessment of current risk groups and interfaces
Develop risk map	Timeline: 12 – 36 months Needs: Literature review Research assistance
Conduct literature / research review	Timeline: 6 months Needs: Research assistance
Create a database of expertise, active research projects and activities	Timeline: 36 months Needs: Funding for database creation Development of platform on BOHRN website
Perform a seasonality study	Timeline: 36 months Needs: Research assistance Funding

Group Notes
Group 4 focused on a series of projects that would help assess the risk groups and characterize the interactions between bats and humans. Long-term the group's focus is to develop a way to effectively communicate these findings to stakeholders and the community

Group Research Mentors
Dr. Ian Mendenhall (Duke-NUS)
Dr. Supaporn Wacharapluesadee (WHO CC, King Chulalongkorn Medical Hospital, Thailand)
Dr. Nesreen Alhmoud (Royal Scientific Society, Jordan) *– note: worked in Group 3*

Subject: BOHRN STEERING COMMITTEE - membership, photos and profiles

Hi everyone
I hope this finds everyone well and safe!

You should have recently received an email from Rebekah inviting everyone that has participated in BOHRN activities to join the member directory. I see that most of you have already done so – thanks! This is a friendly reminder with the info again on how to do this at the bottom of the email.

Other questions for the Steering Committee

a. Confirm that you are OK with your photo on the Steering Committee page https://www.bohrn.net/member
b. Update your SC profile – if you click on your photo or name you come to your page. (here is mine, which I need to update. https://www.bohrn.net/tigga-kingston). If you would like to update it, please send through as a word file to Guzal Masharipova (copied here). Guzal is our wizard behind the website and has worked some miracles to get the membership directory plugged in and is now updating other elements of the website.

Thank you so much! I think Marty will update the SC more broadly with what is going on with BOHRN in the near future – there were budget cuts early in the year, changes in leadership at DTRA BTRP, but it looks like the dust is settling and now is a good time for BOHRN to be active and secure a prominent place in the revamped program/portfolio.

Lastly, BOHRN is a member of the Global Union of Bat Diversity Networks (GBatNet) that brings together 14 networks to secure sustainable bat populations https://gbatnet.blogspot.com/p/about.html. GBatNet recently received support from the US's National Science Foundation for five years which will provide great opportunities for BOHRN to interact with the rest of the global bat research community. You can read the public abstract here https://www.nsf.gov/awardsearch/showAward?AWD_ID=2020595&HistoricalAwards=false

If you have any questions, please do get in touch.

Best
Tigga

USA

http://kingstonlab.org
http://www.seabcru.org

Here is a reminder on the how to join the membership directory

1. Go to https://www.bohrn.net
2. Click on "Join"
3. Create an account, fill out your profile
4. Check the boxes to affirm that you agree with having your information visible to others within the member page, and with the BOHRN mission statement (above)
5. Click "Continue" to be brought to the Members page.
6. Your profile will automatically be entered into the directory, butthis may take a few hours to sync and be visible on the website.
7. From the Members page you should be able to view other member profiles as well as search the directory.

Please feel free to spread the word, and encourage trainees/students/post-doctoral researchers on your teams to join!!

Subject: BOHRN steering committee - preparation for data discussion

Dear BOHRN Steering Committee Members,
As part of our upcoming meeting, Marty and Katie would like us to discuss data curation and data standardization for BOHRN projects. The plan is to begin the discussion during the SC meeting, and then have a broader discussion, on day three, with the full group. On Sunday, Noam Ross from EHA will present some specific ideas around data standardization to kick start the discussion, focusing on how we might approach developing a common database or data collection standard that can be used across BOHRN projects to facilitate broader analyses. Noam works with Kevin on the PREDICT Modeling & Analytics team and has substantial experience with data management and curation.

We'll also discuss whether and how we might want to make existing datasets available to the BOHRN network, to create opportunities for scientists to leverage them to develop new projects or perform new analyses. For this part, Marty has requested that we come prepared with a list or description of datasets, (e.g. those already published) that we have in hand that could be made available to the BOHRN network.

If you have any questions, don't hesitate to reach out to Katie Leahy Marty, or me. I look forward to seeing you all in Phuket soon.

Safe travels.

Cheers,
Jon

Subject: BOHRN Workshop Feedback

Dear all,

We hope you enjoyed the BOHRN workshop and found it as productive as we did. As a follow up to the workshop we have a short survey for you to complete. Your feedback is imperative for moving forward and coordinating the next steps for the BOHRN. Therefore, we would appreciate it if you could please complete the survey NLT Monday 26 November.

Thank you again for your hard work and participation this past week.

Survey link: https://www.surveymonkey.com/r/9CZ5MKH

Kind Regards,

Megan

Subject: BPERNet: Transportation Times and Other Useful Information (30 and 31 January 2017)

Hello, everyone! Welcome to Bangkok. On behalf of the Executive Committee (Dr. Martha Stokes and Dr. Mary Lancaster), we are so pleased that you are able to join us this week for our BPERNet planning meeting and other PMAC activities.

Please use this email as your resource for information regarding transportation, logistics, and other coordinating information for 30 January – 31 January.

30 January – BPERNet Meeting at Chulalongkorn Hospital

1. **The bus will depart from the Renaissance Hotel promptly at 0800** ; please be in the lobby for head count at 0745
2. We will provide coffee and light refreshment during the meeting; you will take lunch at one of the many canteen options at the hotel; please bring about 200 - 300 thai baht (~10 USD) for lunch

31 January – PMAC / BPERNet Field Trip

1. **The bus will depart from the Renaissance Hotel promptly at 0630** ; please be in the lobby for head count at 0615; please make sure that you are on time, as we are caravanning with a delegation from the Centara Hotel and will receive a police escort to move us quickly through traffic
2. We will provide a box breakfast for the bus ride
3. Please make sure that you dress appropriately for this field trip; we strongly suggest covered shoes and loose, comfortable clothing; in addition to this mode of dress we also suggest that you bring accompaniments for spending a day outdoors amongst bat roosts; such as:
    a. Hat
    b. Sunscreen
    c. Sunglasses
    d. Bug spray
    e. Water bottle

We will provide information regarding the Ambassador's reception at the close of tomorrow's meeting.

Again, we are so excited to have you all here. Please do not hesitate to reach out to me or Megan Hudson (copied) if you have any questions.

V/r,

Katie Leahy

Subject: BPERNet Follow Up

All,

We hope you enjoyed the last week and found the BPERNet meeting and field trip as productive as we did. As a follow up to the meeting we have a short survey for you to complete. Your feedback is imperative for moving forward and coordinating the next steps for the RCN. Therefore, if you could please complete the survey NLT Friday, 9 Feb.

Thank you again for your hard work and participation this past week.

Subject: BPERNet Name Change

All,

Thank you for you participation in our survey to consider renaming the BPERNet. From your responses and submitted words to consider, we have decided to move forward with Bat One Health Research Network, BOHRN.

In the next few weeks more information will be rolled out to include the start of an information sharing website. We are still actively planning for a meeting as part of the One Health Congress in June and will follow up with information.

v/r,

Megan

Subject: BPERNet Read-out
Attachment(s): "Bangkok BPERNet ExecSum_v3.docx"

All,

Please find the draft report from our meeting last week. This report includes an executive summary, action items, participant list, working group outcomes, lessons learned from your feedback, and the original slides from the end-of-day brief-out.

We ask that you provide constructive comments (e.g., content changes) no later than 20 February 2018. It is our intent to adjudicate and incorporate any comments with Mary and Marty and then publish a final report on 22 February 2018.

Also, thank you, to everyone who provided feedback via the survey monkey poll. We will be incorporating all of your comments into our meetings going forward.

V/r,

Katie Leahy

TABLE OF CONTENTS

MEETING OVERVIEW

EXECUTIVE SUMMARY

The Bat-associated Pathogen and Ecology Network (BPERNet) Executive and Steering Committees met as a side meeting to the Prince Mahidol Award Conference (PMAC) on 30 January 2018 at the Chulalongkorn Hospital and University in Bangkok, Thailand. This meeting served as a follow-up to its kick-off meeting in Fort Collins, CO in June 2017, where the group chartered research objectives and terms of agreement. Members of the Executive Committee (EC) and the Steering Committee (SC) chairmen developed an agenda to meet the following objectives: (1) define working group focus areas, resource needs, and outreach plans; (2) build strategy maps to identify, prioritize, and address BPERNet research gaps and needs; and (3) discuss short and long-term processes to collect and collate applications to the network. A complete agenda from the meeting in addition to a list of its participants may be found in **Annex A** and **Annex B**, respectively.

The meeting kicked off with welcome remarks from Professor Sutep Gonlachanvit; followed by a review of the interim progress in developing the group Terms of Reference. The Executive Committee leads, Dr. Martha Stokes (CBEP SEA Science Lead) and Dr. Mary Lancaster (CBEP Africa Science Lead) facilitated a review of the network objectives, outlined progress since its last meeting, and set the guidelines for the meeting. Participants then broke out into their research focus areas to begin developing their strategic maps that outlined what the working group should achieve, how success will be measured, risks and needs, and a list of investments, activities and projects to accelerate short and long-term objectives.

Ultimately, meeting organizers and facilitators agreed that the meeting achieved its objectives. Working within their focus group areas, and then interactively using the World Café Method, they were able to develop ambitious multi-year strategies and characterize associated challenges and risks to achieving their goals. The group agreed on the importance of its momentum to develop supportive structures for communication and outreach both internally and externally to firmly establish itself as a unique global network of multi-disciplined researchers who aim to answer complex questions at the nexus of One Health.

The meeting's success is evident in the responses from the SC. The SC was given an opportunity to provide feedback via an anonymous survey shortly after the conclusion of meeting. Unanimously the group agreed that the meeting was productive and outlined a path forward for BPERNet. All members noted that their contributions were beneficial and there is consensus about taking steps to moving forward with research and publications. The survey was sent to all participants via email and a summary of the responses can be found below.

BACKGROUND

In 2014, the Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) began leveraging, enhancing, and convening research networks to accelerate its programmatic and research driven targets and end states. CBEP uses this approach as a way to connect its active funded research projects with other projects to help influence effective change for global health security; translating data into policy. Further, by using relationship-based research networks around the globe, made up of interdisciplinary relationships, it will allow for novel and transformative scientific solutions for the world's largest infectious disease threats.

The Bat-associated Pathogen and Research Network (BPERN) is a CBEP research network that connects multidisciplinary and One Health expertise to address challenges and threats posed by bat-associated pathogens of security concern. The BPERN maintains the standards of all research networks that are supported by CBEP, in which members convene as a body of experts and researchers to: (1) share information, data, samples, and protocols; (2) coordinate research activities; (3) build training events and awareness-building workshops at all levels of decision-making authority; (4) develop community standards and best research practices; (5) create mentorship-based opportunities for students, trainees, and early-career researchers to convene, present, and share ideas; (6) establish a community of international research leaders and champions; and (7) reduce outbreak / transmission risk.

Some of the world's most deadly emerging zoonotic diseases are found in bats, including Nipah, Hendra, and Marburg viruses. There are a number of factors which make bats unique disease reservoirs, including their social behavior, distinct physiology and metabolism, ability to travel long distances, nocturnal activity, species diversity, and long life span (10-20 years, compared with a rat's average life of two years).[1] These special bat characteristics, coupled with the impact of human mediated interactions and environmental changes, create research challenges to understanding the bat's role in the global zoonotic disease ecology, which is further complicated by being difficult animals to control within a typical laboratory setting. The BPERN creates opportunities for policy makers, researchers, conservationists, funders, and students to identify community challenges, develop priority research lists and associated action plans that target needs and gaps, and work at all levels to build awareness of bat-associated disease burden and transmission risks to improve the prevention, detection, diagnosis, and reporting of pathogens of security concern.[2]

MISSION AND VISION

The BPERNet brings together a multidisciplinary and One Health-focused group of scientists, policy makers, research scientists, and medical/veterinary practitioners with interests in bat-related research involving pathogens of security concern. The network builds on community standards and best practices for research. The BPERNet identifies and shares information on research funding opportunities offered by multiple institutions. Most importantly, this network fosters international relationships among collaborators, agencies, and organizations, which can produce long-term, sustainable partnerships that withstand changes in government and organization budgets, priorities, postures, and policies.

All members play a role in operationalizing the objectives of the BPERNet, strengthening linkages and reducing overlap in global research on high-priority pathogens of bats (especially zoonosis) to maximize the efficient use of expertise and resources and accelerate the coordinated development of better disease surveillance and control methods.

---

[1] Hayman, David T.S., "As the bat flies," *Science* 02 Dec 2016: Vol. 354, Issue 6316, pp. 1099-1100 http://science.sciencemag.org/content/354/6316/1099

[2] Schountz, Tony, "Immunology of Bats and Their Viruses; Challenges and Opportunities," *Viruses,* 2014 Dec; 6(12): 4880-4901. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4276934/

NETWORK OBJECTIVES

This network will identify and connect interdisciplinary expertise, convening an agile group to adapt to a wide spectrum of arising challenges and threats. By accomplishing the below objectives BPERNet will enable shared learning and research opportunities, establish new research projects, and facilitate joint applications for funding; thus, increasing the opportunity for peer review, especially if a cross-regional and multi-disciplinary team of authors is involved.

- Facilitate interdisciplinary relationships and collaboration to identify research goals and needs for bat-associated disease research and disease threat reduction; and

- Unify CBEP regions to create a common action plan that yields collaborative and sustainable projects that achieve the following end states:

  (1) better informed policy-makers;

  (2) better informed scientific community regarding funding targets and gaps in areas of research and development;

  (3) better defined threat to global health security from bat-associated pathogens; and

  (4) improved national, regional, and global capacity to detect and respond to pathogens of security concern; and

- Enable better communication, coordination, and outreach at the research and conservation interface.

OUTCOMES FROM RESEARCH FOCUS AREAS BREAKOUT SESSIONS

OPENING COMMENTS

Mr. Lance Books, Division Chief, DTRA CBEP and Professor Sutep Gonlachanvit, Deputy Director of Medicine and Research King Chulalongkorn Memorial Hospital, co-opened the BPERNet meeting by emphasizing the importance of continuing the RCN for the benefit of the One Health mission. The opening message conveyed the need for continuing infectious disease surveillance and providing opportunities to make new connections through research. Both agreed that the BPERNet ensures the future of interdisciplinary scientific research and provides a venue to address global issues.

MEETING FORMAT AND LESSONS LEARNED

The goals of this BPERNet meeting were:

(1) Define working group focus areas, resource needs, and outreach plans;

(2) Build strategy maps to identify, prioritize, and address BPERNet research gaps and needs; and

(3) Discuss short-term and long-term processes to collect and collate applications to the network

These objectives were set as the "true north" for this meeting, providing a target for participants to think about success from the beginning. General meeting instructions emphasized the importance of working collaboratively, but to also think about general limitations that have inhibited research goals. Emphasis was added that these objectives should be owned by the entire group.

Additionally, the SC worked to finalize the Terms of Reference for Trusted Agents (TORFTA). The SC agreed that the TORFTA will remain a living document and that will be reviewed annually.

Based on participant feedback and observations from event planners, the EC and SC chairs agree that future meetings should be longer, with more interactive portions for strategy building and collaboration exercises. One idea is to develop a scenario (based on a case-study) to engage a multi-disciplinary group through different phases or turns of response. Event organizers felt that presentations from members of the group on their current research interests or funded projects would help others to understand linkages and dependencies in their research. Event organizers have documented all lessons learned and changes will be implemented for future meetings.

AGENDA

The meeting agenda was designed to create two breakout sessions to guide working groups through a single strategy map. The morning session included a large group review of the working group research areas and creation of cross-cutting themes. Working groups then moved into their research areas to develop a mission statement, identify objectives, and highlight needs. The afternoon breakout group session had research areas developing initiatives for steps forward and identifying responsibility for these initiatives. After each session, the world café was used as a method to share the group's findings. Members of each group rotated to the other working groups to hear from a group representative and provide feedback on each topic. The second breakout group was followed by a short presentation of findings and a large group discussion on next steps. The full breakout of the agenda can be found in Annex B.

CROSS-CUTTING THEMES

Prior to breakout sessions, the SC worked to identify cross-cutting themes among all four working group areas. The SC agreed these themes were inclusive of the needs of all working groups and would help the RCN in developing outreach plans and strategy maps.

Cross-cutting themes from the focus area group discussion included:

- Communication, outreach, and advocacy of group goals to decision and policy makers;
- Standardizing common language;
- Optimizing database management and IT networks;
- Analyzing modeling; and
- Workforce development

Additionally, the objectives each working group identified highlight a need to research and publish knowledge gaps and identify the effects of spillover on human and animal health.

WORKING GROUP RESEARCH FOCUS AREA

Prior to breakouts; a whole group discussion outlined and defined the working group research focus areas. Below are the focuses of each group along with the research mentors for each group.

WORKING GROUP 1: HOST/PATHOGEN BIOLOGY AND INTERACTIONS

- Bat Physiology
- Bat Immunology
- Bat Pathology and pathophysiology
- Bat Pathogen Community Ecology (Co-infections and Co-morbidities)
- Distribution of Pathogens Among Species
- Develop Modeling Approaches for Host Dynamics and Epidemiology

WORKING GROUP 1 RESEARCH MENTORS

- Dr. Joram Buza, Nelson Mandela African Institute of Science and Technology, Tanzania
- Dr. Vivek Kapur, Penn State University, U.S.
- Dr. DeeAnn Reeder, Bucknell University, U.S.
- Dr. Gavin Smith, Duke-NUS, Singapore
- Dr. Mary Lancaster, DTRA CBEP, U.S.

WORKING GROUP 2: PATHOGEN SURVEILLANCE, DIAGNOSTIC CAPACITY, AND EPIDEMIOLOGY

- Molecular Epidemiology
- Distribution of Pathogens Geographically and Phylogenetically
- Detection, Diagnosis, and Reporting of Bat-associated Pathogens
- Establish Commonly Used Guidance on Sampling

WORKING GROUP 2 RESEARCH MENTORS

- Dr. Catalino Demetria, Research Institute for Tropical Medicine, Philippines
- Dr. Jon Epstein, EcoHealth Alliance, U.S.
- Dr. Tamar Kutateladze, National Center for Disease Control and Public Health, Georgia
- Dr. Abel Wade, National Veterinary Laboratory, Cameroon
- Dr. Keti Sidamonidze, National Center for Disease Control and Public Health, Georgia

WORKING GROUP 3: ECOLOGY SETTING (BAT, DOMESTICATED ANIMALS, AND WILDLIFE INTERFACE)

- Bat Behavior, Distribution, and Movement
- Domesticated Animals and Wildlife Behavior, Distribution, and Movement impact on Interaction with Bats
- Effect of Anthropogenic Disturbance and Modification on Pathogen Dynamics and Spillover Risk

WORKING GROUP 3 RESEARCH MENTORS

- Dr. Paul Cryan, United States Geological Survey Fort Collins Science Center, U.S.
- Dr. Tigga Kingston, Texas Tech University, U.S.
- Dr. Rebekah Kading, Colorado State University, U.S.
- Dr. Eiichi Hondo, Obihiro University of Agriculture and Veterinary Medicine, Japan

WORKING GROUP 4: HUMAN-BAT INTERACTIONS

- Human Behavioral Risk Characterization
- Hunting and Commodity Chain
- Ecotourism
- Interactions in Human Dwellings

WORKING GROUP 4 RESEARCH MENTORS

- Dr. Kevin Olival, EcoHealth Alliance, U.S.
- Dr. Ian Mendenhall, Duke-NUS, Singapore
- Dr. Supaporn Wacharapluesadee, King Chulalongkorn Memorial Hospital, Thailand
- Dr. Lela Urushadze, National Center for Disease Control and Public Health, Georgia
- Dr. Nesreen Alhmoud, Royal Scientific Society, Jordan
- Dr. Marty Stokes, DTRA CBEP, U.S.

OUTCOMES FROM RESEARCH FOCUS AREA BREAKOUT SESSIONS

BRIEF-OUT FROM WORKING GROUP SESSIONS

Working within their focus group areas, each develop mission statements, multi-year objectives, measurements for success, and identified overall challenges to success. In the table below, mission statements convey the group's long-term overarching goal while multi-year objectives are each outlined with a corresponding measure for success. Finally, the groups identified key challenges to the overall success of their work. The below table reflects a summary of the key findings from the breakout groups and world café. For the original working out-brief please reference Annex C.

Working Group 1 Mission: Explain the intrinsic and extrinsic characteristics that make certain bats susceptible and spread certain diseases and accurately assess the risk of spillover to another animal host.

Objectives	Measurements	Overall Challenges
Objective 1: Complete a systematic review of the knowledge gaps on modeling systems. **Objective 2:** Identify modeling systems that are representative of all geographic and phylogenetic areas. **Objective 3:** Evaluate the transmission risk and spillover of pathogens to another animal host.	**Objective 1:** Publish systematic review of modeling systems and knowledge gaps that were defined. **Objective 2:** Model system is defined, characterized, and validated. **Objective 3:** Intrinsic and extrinsic risk factors are identified for major diseases and geographic areas.	• Objectives require a multidisciplinary team. • Consortia would be needed for model systems review and validation.

Working Group 2 Mission: Form regional networks to establish a common methodology for surveillance and sustain the surveillance for both human and animal health. In addition to understanding spillover risk and epidemiology of bat pathogens.

Objectives	Measurements	Overall Challenges
Objective 1: Create gap analysis of diagnostic tools. **Objective 2:** Create outreach to various groups of researchers and create awareness among the public and science community. **Objective 3:** Establishing a common methodology for surveillance.	**Objective 1:** Publish systematic review understanding the epidemiology of bat pathogens. **Objective 2:** Formation of regional networks. **Objective 3:** Fully understanding the risk of spillover and developing a set of standards for surveillance.	• The logistics and bureaucracy of creating a multidisciplinary team. • Funding to support the efforts to standardize surveillance.

Working Group 3 Mission: Define how and to what extent the ecological context of bats, and human influence on that context, influence pathogen dynamics and spillover threats		
Objectives	**Measurements**	**Overall Challenges**
Objective 1: Engage the ecological community to define system uniqueness and interdependencies. **Objective 2:** Advocate for ecological design and analysis frameworks to pathogen research. **Objective 3:** Build capacity for disease researchers to gather ecological data to provide context for their studies. **Objective 4:** Define emerging ecological principles that could inform spillover threats. **Objective 5:** Establish key messages and conduct efforts to promote a culture of conservation among One Health researchers, practitioners, and stakeholders.	**Objective 1:** Pathogen research community acknowledges and integrates ecological systems and interdependencies. **Objective 2:** BPERNet research projects are designed using the framework for well-balanced outcomes. **Objective 3:** More studies return to ecological data. **Objective 4:** Emerging ecological principles become widely-accepted governing principles for practice. **Objective 5:** BPERNet establishes itself as a consistent and unbiased perspective from the community and its statements are widely accepted and distributed.	• Science communities have polarized and insular view of bats and diseases. • Lack of collaboration and communication efforts.

Working Group 4 Mission: Fully develop, understand, and communicate the bat and human interface to key stakeholders and communities.		
Objectives	**Measurements**	**Overall Challenges**
Objective 1: Develop and test policy interventions for specific human-bat interfaces. **Objective 2:** Communicate findings to key stakeholders. **Objective 3:** Develop global risk maps to assess existing data and validate risk maps. **Objective 4:** Identify high risk groups and develop education platforms to measure knowledge, attitudes, and practices.	**Objective 1:** Policy interventions for human bat interfaces are developed and put into place. **Objective 2:** Effectively communicate and publish findings of studies. **Objective 3:** Publish global risk maps highlighting geographic areas of risk. **Objective 4:** Getting community buy-in and understanding of concepts.	• Truthful responses in behavioral research on bat-human interactions. • Accuracy of risk map and models. • Cultural barriers and beliefs.

ACTION ITEMS

The following Action Items were recorded and compiled by the organizational and administrative support staff of CBEP / Executive Committee for the BPERN.

ACTION	APPROACH FOR COMPLETION WITH DATES	RESPONSIBLE AGENTS
Develop communication plan	(1) Themes and key messages (2) New name (3) Outreach (4) Social media (5) Recruitment and marketing	(1) Contingent on establishment of 5th working group; looking into Science Communication experts
Develop website plan	(1) Communication and outreach (2) Collaboration (3) Research mapping	(1) Contingent on establishment of 5th working group.
Publication of protocols and assays	(1)	(1)
Working Groups complete mission statements ***Change?*** Conduct System Reviews to Outline Knowledge Gaps	(1) ***	(1) ***Contingent on Working Group Leads
Conduct Series	(1) SEABCRU (2)	(1)
Publication of Perspectives and Policy piece	(1) Concept pitch (2) Outline (3) First Draft (4) Final Draft	(1) Perspectives Paper: Dr. Mary Lancaster, CBEP and Dr. Vivek Kapur, Penn State (2) Policy Forum: Dr. Marty Stokes, CBEP and Dr. Jon Epstein, EcoHealth Alliance
Conduct a 'funders meeting'	(1)	(1) CBEP

Star-Idaz

Economist debate-style forum

PARTICIPANT FEEDBACK

An after-event survey was sent to the SC to collect information on their progress and overall thoughts on the progress of the RCN. Members were asked to answer the following questions:

1. What did you like about the meeting?
2. Do you think the objectives for the 30 January BPERNet meeting were achieved? Please explain your answer.
3. What do you wish we did differently?
4. What does success of this network look like to you, for your field of study?
5. Will you be able to attend the next meeting in Saskatoon Saskatchewan (5th International One Health Congress) 22-25 June?
6. What do you wonder? As an example, “Do you wonder if this effort is worth your time?”
7. Additional comments.

Responses were collected from the majority of the attending SC and reflected a positive outlook on both the progress of the meeting and the future of BPERNet. The SC felt the 30 January meeting was well organized, with a clear agenda that increased the productivity of each working groups. Comments from members pointed to the formally developed themes and roles for each working group as the main reason for the meeting’s success. The SC agreed success of BPERNet will be achieved when the gaps identified are addressed, there is a standardization of data collection, and the completion of one or more research projects advancing the understanding of and response to emerging pathogen reservoirs in bats. Overall, the only change the group asked for was to extend the next BPERNet meeting to at least two full days. The majority of members will be present at the 5th International One Health Congress meeting and a longer side BPERNet meeting should be arranged during this time period.

ANNEX A – PARTICIPANTS

The following participants attended or were invited to attend the

STEERING COMMITTEE MEETING INVITEES, DID ATTEND		
Mendenhall	Ian	Duke-NUS, Singapore
Buza	Joram	Nelson Mandela African Institute of Science and Technology, Tanzania
Kapur	Vivek	Penn State University, U.S.
Olival	Kevin	EcoHealth Alliance, U.S.
Epstein	Jonathan	EcoHealth Alliance, U.S.
Kading	Rebekah	Colorado State University, U.S.
Urushadze	Lela	National Center for Disease Control and Public Health (NCDC), Georgia
Kutateladze	Tamar	National Center for Disease Control and Public Health (NCDC), Georgia
Sidamonidze	Keti	National Center for Disease Control and Public Health (NCDC), Georgia
Wacharapluesadee	Supaporn	WHO CC for Research and Training in Viral Zoonoses, King Chulalongkorn Memorial Hospital, Thailand
Wade	Abel	National Veterinary Laboratory of Cameroon (LANAVET)
Demetria	Catalino	RITM, Philippines
Kingston	Tigga	Texas Tech University, U.S.
Cryan	Paul	USGS Fort Collins Science Center, U.S.
Reeder	DeeAnn	Bucknell University, U.S.
Smith	Gavin	Duke-NUS, Singapore
Alhmoud	Nesreen	Royal Scientific Society, Jordan
Hondo	Eiichi	Obihiro University of Agriculture and Veterinary Medicine, Japan
STEERING COMMITTEE MEETING INVITEES, DID NOT ATTEND		
Kityo	Robert	Makerere University, Uganda
CBEP AND CBEP CONTRACTOR INVITEES, DID ATTEND		
Lancaster	Mary	DTRA CBEP
Stokes	Marty	DTRA CBEP
Brooks	Lance	DTRA CBEP
Newman	Carl	DTRA CBEP
Leahy	Katie	GSE
Hudson	Megan	GSE

ANNEX B – MEETING AGENDA

The following agenda was set for the meeting. The majority of discussions focused on administration, organization, and focus of the network. The group did not get to the topics to prioritize research gaps and set action plans with short and long-term milestones and deliverables. Event facilitators organized questions and prompts for those sessions, which they will use for the next BPERN meeting.

Time	Session	Notes
0830 - 0845	Introduction and Meeting Objectives	Lance Brooks and Sutep Gonlachanvit will welcome all participants and provide a brief overview of the meeting objectives for the week
0845 - 0900	Þ Review interim accomplishments since 27 June Þ Q&A on TORFTA changes Þ Call for votes to accept TORFTA	Executive Committee members will provide an overview of the TORFTA and mission areas; all participants will receive final version ahead of meeting
0900 - 1000	Working Group Focus Areas	Review WG focus areas that were outlined during the 27 June meeting Þ Review breakout group objectives and end goals Þ Review strategy map
1000 - 1015	Tea Break	
1015 - 1115	Breakout Group Session I	Breakout Group Session 1 Objectives: Þ Define WG research areas (sub-focus area definitions) Þ List and prioritize research questions and potential projects for each area Þ Identify internal and external research dependencies for each Working Group
1115 - 1200	Breakout Group Session I Interactive Feedback	Each group will participate in world café and rotate to review each group's findings
1200 – 1330	Working lunch / Open discussion	Open discussion objectives Þ Discuss group marketing campaign Þ Members should be prepared to introduce other network affiliations, conferences, and meeting opportunities to market the network, globally Þ Discuss long-term process to collect and collate applications to the network
1330 – 1430	Breakout Group Session II	Breakout Group Session 2 Objectives:

		⊳ List out WG research coverage (who is researching what and where) ⊳ Identify research gaps and needs ⊳ Identify WG resource and coverage needs (e.g., target environmentalists in Europe); identify critical POCs for membership ⊳ Begin drafting short and long timelines and work plans
1445 – 1530	Breakout Group Session II Interactive feedback and brief-out	Each group participated in the world café and then briefs out their discussions according to the objectives; brief-out 5 minutes / WG
1530-1545	Tea Break	
1545 – 1630	End of session	End of Session Objectives: ⊳ Review Strategy Map ⊳ Review Action Items ⊳ Discuss date, level of participation, and location for next meeting (all participants should come prepared to briefly discuss their ideas for this topic)

ANNEX C – GROUP BRIEF-OUT SLIDES

Each group was provided 10 minutes at the end of the day to present their strategic mapping work; below are the final slides that were presented.

Group 1

5 MINUTES

What must the Working Group achieve?	How will success be measured?
OBJECTIVES	MEASURE
• Almost all (ex. NIH, WT, WHO, France, Germany, India, China, Australia)	Almost all (ex. NIH, WT, WHO, France, Germany, India, China, Australia)

• Systematic review/knowledge gaps on model systems and transmission risk (short-term goal)
• RFP for model systems to answer:
  • Innate and adaptive immune response
  • Mechanisms of susceptibility
  • EnvironmentaL/I host conditions that are necessary for spillover
  • Resistance and susceptibility of certain bats species and certain pathogens
  • Co-infections and their role in pathogen ecology / spillover risk
	• SYSTEMATIC REVIEW / KNOWLEDGE GAPS DEFINED - PUBLISHED
	• RFPS ISSUED - TEAMS ASSEMBLED / ESTABLISHED
	• MODELS DEFINED / CHARACTERIZED / VALIDATED
	• KEY INTRINSIC/EXTRINSIC RISK FACTORS IDENTIFIED FOR MAJOR DISEASES / GEOGRAPHIES

1. Immunologist 2. Genomics 3. Cellular and molecular biologist • Ecologist /Trans Dynamic model • Systems biologist • Risk assessment • Bioinformatics • Microbiologist • Infectious disease	1. RESEARCHERS; FUNDING AGENCIES; POLICY MAKERS; OIE/WHO

Investments, activities, and projects	Responsibility	Needs and risks
INITIATIVES	WHO	CHALLENGES
• BPERN / Multiple other	Almost all (ex. NIH, WT, BBSRC/DfId OTHER COUNTRY FUNDING AGENCIES)	• Multidisciplinary by nature there isn't a single funding source • Consortia would need to be created for model systems

• Model Systems
  • Systematic review
  • RFP
• Natural and experimental disease transmission models
• Tool Kits
	Working Group 2 creates systematic review in which we identify gaps and lay out what would need to be in a RFP	• Quantifying and communicating Risk
		• Lack of baseline knowledge

1. Immunologist 2. Genomics / bioinformatics 3. Cellular and molecular biologist • Ecologist /Disease transmission dynamic modelers • Systems biologists • Risk assessment • Microbiologists / Infectious disease specialists	Researchers; funding agencies; other stakeholders	• Quantifying and communicating Risk • Lack of baseline knowledge • Promoting collaboration

Group 3

5 MINUTES

Group 3 Mission: define how and to what extent the ecological context of bats, and human influence on that context, influence pathogen dynamics and spillover threats

What must the Working Group achieve?	How will success be measured?
OBJECTIVES	MEASURE
Objective 1: Engage the ecological community (including research groups, individuals, and networks) to define system uniqueness and interdependencies (movement, community, nutritional, physiological, social, reproductive, conservation, and population ecologies etc. **Objective 2:** Bring ecological design and analysis frameworks to pathogen research; advise the community of innovative and supportive technologies **Objective 3:** Build capacity for disease researchers to gather ecological data to provide context for their studies **Objective 4:** Define emerging ecological principles that could inform spillover threats **Objective 5:** Establish key messages and conduct efforts to promote a culture of conservation among One Health researchers, practioners, and stakeholders; BPERNet SC provides timely statements on potentially contentious research	**Objective 1 Measurement:** Pathogen research community acknowledges and integrates ecological system and interdependencies **Objective 2 Measurement:** BPERNet research projects are designed using the frame work for well-balanced outcomes **Objective 3 Measurement**: More studies are returning ecological data **Objective 4 Measurement:** Emerging ecological principles become widely-accepted governing principles for practice **Objective 5 Measurement:** BPERNet establishes itself as a consistent and unbiased perspective from the community and its statements are widely accepted, respected, and distributed

Group 3 Mission: define how and to what extent the ecological context of bats, and human influence on that context, influence pathogen dynamics and spillover threats

Investments, activities, and projects	Responsibility	Challenges, needs, and risks

1. Conduct a literature review of bat-associated papers to assess how many incorporated conservation principles and authorship
2. Conduct DTRA call for sampling opportunities associated with existing ecological research
  1. Demonstrate contribution to ecology of disease emergence
  2. Demonstrate existing funding (not associated with potential funding)
3. Ensure that any future solicitations include language that explicitly incorporates an ecology framework where relevant
4. Collect case studies for messaging
5. As part of a repository of 'tool kits', develop an ecology 'tool kit'; conduct tactical field activities to learn how to use and teach-back the tool kit
6. International Bat Research Conference (IBRC) 2019 – attend and participate (with 5-10 participants for discussion Q&A)
7. Convene a series of 'conservation awareness-building' workshops
8. FOR NEXT BPERNet MEETING: longer planning meeting, develop and work through a scenario that incorporates all the working group for future discussion-based training events
	1. WG
	2. CBEP / BPERNet
	3. CBEP (and other fudners)
	4. WG – 3
	5. WG – 3
	6. BPERNet
	7. WG – 3
	8. BPERNet
		• "The Great Divide" – solution: build awareness
		  • Vocal and polarized bat community
		  • Insular bat and disease communities
		  • Insensitive disease community
		• Lack of collaborative efforts
		• Communication issues

Group 4

5 MINUTES

What must the Working Group achieve?	How will success be measured?
OBJECTIVES	MEASURE
Identify other funding initiatives	Number of visits to website Number of proposals submitted and projects funded
Better understand bat/human interface Develop and test policy interventions for specific human-bat interfaces	Baseline knowledge and gaps identified Database development Maps and models developed Guidelines for human behaviroal risk characterization developed and used Intervention policies developed and tested
Communicate findings to key stakeholders • Policy makers • Community members (high risk groups)	Number of workshops and attendees (conventional metrics) Before and after surveys for KAPs

Investments, activities, and projects	Responsibility	Needs and risks
INITIATIVES	WHO	CHALLENGES
Create and curate web page with potential funding opportunities	BPERN; CBEP (to liaise w other USG funders); country governments	Lack of transparency and coordination among donors and recipients (=duplication) Silo'ing of funding Some countries (e.g. Singapore) doesn't fund outside of country Shaping national/country funding priorities
Develop global risk maps Assess existing data and literature review Research studies/support for ecol, social, and econ drivers Studies of seasonality Identify and model policy interventions Validate/ground-truth risk maps	BPERN, academics, research orgs, NGOs, and countries	Truthful responses in behavioral research Ensuring interventions developed will be acceptable and econ viable. Accuracy of risk maps/models
Identify target audience, and high risk groups Develop education platforms/materials Research to measure changes in knowledge, attitudes, and practices (KAP)	BPERN; SEABCRU; social behavioral scientists (needed); communication and PR specialists	Getting community buy-in and understand concepts Cultural barriers and beliefs (e.g. bats are medicinal to eat) Dissemination of info to larger group

Subject: Draft Executive Summary and Website Materials
Attachment(s): "BOHRN Saskatoon_ExecutiveSumv.6.docx"

All,

Please find the draft report from our BOHRN meeting 20-21 June. This report includes an executive summary, action items, participant list, working group outcomes, and your research quad charts.

We ask that you provide constructive comments (e.g., content changes) no later than 18 July. It is our intent to adjudicate and incorporate any comments to then publish a final report.

In addition, you will find an updated version of the website map here (https://docs.google.com/document/d/1x5GdAKEPpKXTol9utZiYvaGoXNtOQsyTdlub1WvN0tk/edit?usp=sharing). Each page has the title of the website page and the content, make edits, as you see fit, to the language to help us better develop the website.

As a reminder, we will be adding individual bios to the website. If you have not already done so, you may submit your information here: https://www.surveymonkey.com/r/BPMTG2T

You will find the report contains softened language to add a more conservationist view point, please review the language within the report and on the website.

v/r,

Megan

Executive Summary
Saskatoon June 2018

BOHRN

Bat One Health Research Network

BOHRN Saskatoon – Meeting Overview

Executive Summary

On 20-21 June 2018, the Bat One Health Research Network (BOHRN) Executive and Steering Committees gathered in Saskatoon, Saskatchewan (Canada) in advance of the 5th International One Health Congress. The two-day meeting was organized and hosted by the Defense Threat Reduction Agency (DTRA) Cooperative Threat Reduction Directorate, Biological Threat Reduction Department (CBEP) in its capacity as a sponsor of life sciences research-based Threat Reduction Networks (TRNs). The meeting served as a forum to advance the group's core agenda of enabling interdisciplinary collaboration at the interface of biological threat reduction, research, and conservation.

> *"Shifting priorities and budgets necessitate sustainable and enduring structures of knowledge and capability to meet the challenges of a complex, interconnected world."*
>
> Mr. Lance Brooks
> Biological Threat Reduction Department

The meeting began with introductions from Mr. Lance Brooks (Director), Dr. Martha Stokes (Southeast Asia Science Lead), and Dr. Mary Lancaster (Africa Science Lead) from CBEP. They welcomed the group and provided an update on their program's priority for supporting TRNs as opportunities to build and enhance local and regional expertise-based relationships that could identify, characterize, and mitigate biological threats sooner.

Based on the feedback and outcomes from previous meetings, event organizers designed an agenda to meet the following three objectives for the BOHRN meeting in Saskatoon:

- Better understand peer knowledge and interests through presentation of active research projects and other activities
- Continue work on focus area action plans that yield collaborative and sustainable projects
- Discuss challenges to and opportunities for increased network collaboration

The meeting was organized into three sessions. The first session provided time for members of the steering committee to outline their research activities via quad chart, which allowed the participants to better understand each other's research interests and funding sources. The quad chart format provided space for the presenters to outline challenges or questions pertaining to their research, which spurred discussions on comprehensive migration mapping, sustaining a cold chain for sample collection, transport, and preservation, and building consistencies in data collection.

The second session featured break-out group discussions on BOHRN's four focus areas: (1) Host-pathogen biology and interactions; (2) Pathogen surveillance, diagnostic capacity, and epidemiology; (3) Ecology setting; and (4) Human-bat interactions. The Breakout groups were asked to finalize the focus area mission statements, draft a list of short and long-term activities and projects for each objective and/or goal set during the Bangkok meeting, and create focus area workplans. The breakout groups presented their work to the larger group for discussion which emphasized the overarching needs for virtual communication and outreach.

The third and final session featured presentations from Los Alamos National Laboratory (LANL) on research network analysis, the National Public Health Laboratory in Tbilisi on its novel disease diagnostic capabilities, and a discussion about potential upcoming BOHRN events. The meeting concluded with a review of its action items and discussions. Members of BOHRN who were present agreed that the next meeting should take place in advance of the International Meeting on Emerging Diseases and Surveillance (IMED) 9-12 November 2018 in Vienna, Austria. Event organizers and participants felt they achieved the meeting's objectives and look forward to the next meeting tentatively scheduled for 8-9 November 2018.

BOHRN Background

In 2013, CBEP began leveraging, enhancing, and convening TRNs to accelerate its programmatic targets and end states. CBEP employs this approach as a way to connect its active funded research projects with other projects to improve global health security, building consistency in data sets, and facilitate more confident decision-making by policy makers. Relationship-based networks around the globe, made up of interdisciplinary researchers, allow for novel and transformative scientific solutions for the world's high-impact infectious disease threats.

BOHRN connects multidisciplinary and One Health expertise to address research-based capability gaps and threats posed by bat-associated pathogens of security concern. The group maintains the standards of all research networks that are supported by CBEP, in which members convene as a body of experts and researchers to: (1) share information, data, samples, and protocols; (2) coordinate research activities; (3) build training events and awareness-building workshops at all levels of decision-making authority; (4) develop community standards and best research practices; (5) create mentorship-based opportunities for students, trainees, and early-career researchers to convene, present, and share ideas; (6) establish a community of international research leaders and champions; and (7) reduce outbreak and disease transmission risks.

Why Bats?

Scientists hypothesize that some of the world's most deadly emerging zoonotic diseases are found in bats, including Nipah, Hendra, and Marburg viruses. However, because bats contribute significantly to the health and diversity of many environments around the world, a conservation-minded approach to their study is necessary. There are a number of factors which could make bats unique disease reservoirs, including their social behavior, distinct physiology and metabolism, ability to travel long distances, nocturnal activity, species diversity, and long life span (10-20 years, compared with a rat's average life of two years).[1] These special bat characteristics, coupled with the impact of human-mediated interactions and environmental changes, create research challenges to understanding the bat's role in the global zoonotic disease ecology, which is further complicated by being difficult animals to study within a typical laboratory setting.

BOHRN is a global network of conservationists, disease ecologists, and clinical virologists who have organized to better understand how bat-borne disease threats filter through ecological systems. BOHRN creates opportunities for policy makers, researchers, conservationists, funders, and students to identify community challenges, develop priority research lists and associated action plans that target needs and gaps, and work at all levels to build awareness of bat-associated disease burden and transmission risks to improve the prevention, detection, diagnosis, and reporting of pathogens of security concern.[2] This group, under sponsorship from CBEP, has established objectives to collaborate on multi-disciplinary research and establish standards for lab and field research practices.

BOHRN Mission and Vision

BOHRN convenes multi-disciplinary and One Health-focused scientists, policy makers, research scientists, and medical/veterinary practitioners with interests in bat-related research involving pathogens of security concern. The network builds on community standards and best practices for research. BOHRN identifies and shares information on research funding opportunities offered by multiple institutions. Most importantly, this network fosters international relationships among collaborators, agencies, and organizations, which can produce long-term, sustainable partnerships that withstand changes in government and organization budgets, priorities, postures, and policies.

All members play a role in operationalizing the objectives of BOHRN, strengthening linkages and reducing overlap in global research on high-priority pathogens of bats (especially zoonosis) to maximize

[1] Hayman, David T.S., "As the bat flies," *Science* 02 Dec 2016: Vol. 354, Issue 6316, pp. 1099-1100 http://science.sciencemag.org/content/354/6316/1099

the efficient use of expertise and resources and accelerate the coordinated development of better disease surveillance and control methods.

BOHRN Objectives

This network will identify and connect interdisciplinary expertise, convening an agile group to adapt to a wide spectrum of emerging challenges and threats. By accomplishing the below objectives BOHRN will enable shared learning and research opportunities, establish new research projects, and facilitate joint applications for funding; thus, increasing the opportunity for peer review, especially if a cross-regional and multi-disciplinary team of authors is involved.

- Facilitate interdisciplinary relationships and collaboration to identify research goals and needs for bat-associated disease research and threat reduction; and
- Unify CBEP regions to create a common action plan that yields collaborative and sustainable projects that achieve the following end states:
    - Better informed policy-makers;
    - Better informed scientific community regarding funding targets and gaps in areas of research and development;
    - Better defined threat to global health security from bat-associated pathogens; and
    - Improved national, regional, and global capacity to detect and respond to pathogens of security concern; and
- Enable better communication, coordination, and outreach at the research and conservation interface.

Meeting Outcomes

Results from the Breakout Groups

On the first day of the meeting, following presentations from each of the participants on their research focus areas, meeting attendees "broke out" into four working groups. They were instructed to continue work on the objectives and goals set at previous meetings, creating workplans short and long-term intentions. Due to scheduling issues, all of the working groups were not fully represented, so other members were asked to fill-in for different groups. The following write-up describes the outcomes from the breakout group session.

Group 1: Host-Pathogen Biology and Interactions

Group 1: Host-Pathogen Biology and Interactions **Focus Area 1:** Bat physiology and immunology **Focus Area 2:** Bat pathogen community biology (e.g., coinfections and comorbidities) **Focus Area 3:** Distribution of pathogens amongst species **Focus Area 4:** Develop modeling approaches for host dynamics and epidemiology	
MISSION STATEMENT: Explain the determinants of tolerance, transmission, and spillover of pathogens by bats at individual and population levels.	
Objective 1	Complete a systematic review of the knowledge gaps on modeling systems
Objective 2	Identify model systems that are representative of all geographic and phylogenic areas
Objective 3	Evaluate the transmission risk and spillover of pathogens to other animal hosts
Projects or Activities	**Timeline / Responsible Authority / Needs (e.g., funding or other support**
Develop cell lines and bat animal models	Long-term lab study
IgM immunoassay	Long-term lab study
Develop methods for determining the age of bats	Long-term lab/field study
Determine the timing of viral shedding and the effects of environmental stresses	Long-term lab/field study
Determine co-infection in bat species	Long-term lab/field study
Determine temperate versus tropical variables associated with infection (hibernation periods / viral replication)	Long-term lab/field study; study species that live in both temperate and tropical locations; study climate change
Understand climate change in respect to physiology	Long-term lab/field study; study species that live in both temperate and tropical locations; study climate change
Map funding landscape / reach out to program officers from agencies	Short-term project (within 6-months) to map funders Long-term project (within 1-year) to host a funders meeting

	Need to identify funders with different interests in the same biological/ecological system to provide long-term funding
Develop heat stable preservatives	Long-term lab/field study
Develop smaller telemetry and physiology sensors	Long-term lab/field study

Group Notes

Group 1 discussed ways the need to mine existing studies for data, which could extend the longevity of data collection and the breadth of data sets. They additionally requested a funders' meeting to identify other program officers and tech companies that would be interested in BOHRN research projects. The group suggested providing opportunities for training, which could include EDGE at Los Alamos National Laboratory for bioinformatics and next generation sequencing. The group discussed the need to identify funders with different interest in the same biological/ecological system that can provide more longer-term funding and to also engage with biologists from regions that have expertise on bat ecology and history.

Group Research Mentors

Dr. Mary Lancaster, DTRA CBEP

Dr. Jon Epstein (EcoHealth Alliance) *– note: ordinarily works Group 2*

Dr. Lela Urushadze (NCDC, Georgia) *– note: ordinarily works Group 4*

Dr. Joram Buza (Nelson Mandela-African Institute of S&T, Tanzania) *– note: invited, could not attend*

Dr. Vivek Kapur (Penn State University) *– note: invited, could not attend*

Dr. DeeAnn Reeder (Bucknell University) *– note: invited, could not attend*

Dr. Gavin Smith (Duke NUS Medical School, Singapore) *– note: invited, could not attend*

Group 2: Host-Pathogen Biology Interactions

Group 2: Pathogen Surveillance, Diagnostic Capacity, and Epidemiology **Focus Area 1:** Molecular epidemiology **Focus Area 2:** Distribution of pathogens geographically and phylogenetically **Focus Area 3:** Detection, diagnosis, and reporting of bat-associated pathogens **Focus Area 4:** Establish commonly used guidance on sampling	
MISSION STATEMENT: Form regional networks to establish a common methodology for surveillance and sustain the surveillance for both human and animal health. In addition to understanding spillover risk and epidemiology of bats	
Objective 1	Fully establish a baseline of animal health and public health laboratories for equipment, staff, and diagnostic tools
Objective 2	Build awareness amongst the research, public health, and other science communities
Objective 3	Establish a common methodology for surveillance
Projects or Activities	**Timeline / Responsible Authority / Needs (e.g., funding or other support)**
Develop assessment tool and conduct capability assessments in laboratories to establish baseline requirements for conducting NGS and other diagnostic protocols for detecting novel and routine diseases from bats	Timeline: Immediate: identify laboratories to assess (likely National Reference Labs, Ministries or Departments of Public (human) and Animal Health) 1-9 Months: create, distribute, and receive feedback questionnaires from labs 9-12 Months: conduct lab visits (as necessary) to identify inconsistencies and fill in knowledge gaps 12-18 Months: assess data, send feedback to labs, and publish report on findings Needs: Technical support and funding
Conduct outreach through meetings with multisectoral stakeholders and social media	Timeline: Immediate: identify opportunities for side meetings at larger animal and public health events with topics related to diagnostic surveillance; identify POCs to serve on One Health committees 6 Months: present research findings and publications; form country-specific One Health committees to sustain awareness and serve as organizers for regional meetings (e.g., 2-3 Animal and Public Health researchers / university) 12 Months: form outreach teams that can network through social media, perform website updates, and survey additional information from other networks and associations Needs:

	Identify potential funders for logistics and planning support; need technical support for social media, web design, and communications
Establish a common methodology for diagnostic surveillance	Timeline: Long-term, after completion of needs assessment tool and implementation 2+ years to implement Needs: Funding for equipment and technical training; resources to develop EQA

Group Notes

Group 2 worked to emphasize the need for commonality (technique, tools, communication, and lexicon) and communication. They worked to offer a plan that identifies baseline tools for lab-based disease surveillance and sets up a system of multi-sectoral outreach and communication.

Group Research Mentors

Dr. Catalino Demetria (Research Institute for Tropical Medicine, Philippines)
Dr. Tamar Kutateladze (NCDC, Georgia)
Dr. Jon Epstein (EcoHealth Alliance) *– note: worked in Group 1*
Dr. Abel Wade (National Veterinary Laboratory, Cameroon) *– note: invited, could not attend*
Dr. Keti Sidamonidze (NCDC, Georgia) *– note: worked in Group 3*

Group 3: Ecology Setting (Bat, Domesticated Animals, and Wildlife Interface)

Group 3: Ecology Setting (Bat, Domesticated Animals, and Wildlife Interface) **Focus Area 1:** Bat behavior, distribution, and movement **Focus Area 2:** Domesticated animals and wildlife behavior, distribution, and movement and impact on interaction with bats **Focus Area 3:** Effect of anthropogenic disturbance and modification on pathogen dynamics and spillover risk	
MISSION STATEMENT: Define how and to what extent the ecological context of bats, and human influence on that context influence pathogen dynamics and spillover threats.	
Objective 1	Improve coordination at the One Health / conservation interface
Objective 2	Define ecological principles that could inform spillover threats
Objective 3	Conduct conservation-minded messaging and outreach
Projects or Activities	**Timeline / Responsible Authority /** **Needs (e.g., funding or other support)**
Quantify interdisciplinary relationship through assessment of publications that feature animal and/or public health, zoonotic disease focus and awareness	Timeline: 6-months post-identification of search parameters Needs: Require BOHRN help in defining search parameters (set as agenda item for next meeting) Research and lit review assistance
Define lit review search parameters for study	Timeline: 6-months Needs: Identify target journals for publication; research guidelines for conducting and publishing a lit review
Publish position paper advocating for improved relationships amongst conservation and One Health communities and suggesting collaborative research projects as a way to bridge differences	Timeline: 1-year (NLT summer 2019) Needs: Research assistance
Develop a repository of tool kits, safety and research guidelines for protecting human and bat health; publish available materials on the BOHRN website	Timeline: 6-months to collect information into training guides for use at field workshops

	Needs: Research assistance; meeting support
Conduct tactical field training activities and a “train the trainer” model	Timeline: 6-months (next BOHRN meeting) establish goals and objectives 9-months establish first training event (Uganda) Needs: Planning / funding / logistics support Funding support for implementation
Build case-control studies for training purposes in messaging	Timeline: 6-months for use during training events Needs: BOHRN group support for case-control study ideas
Participate in One Health / conservation conference panels	Timeline: International Bat Research Conference (IBRC) June 2019 Needs: Participation from BOHRN

Group Notes

Group 3 focused on engaging the ecological community and analyzing frameworks for pathogen research through assessing One Health interactions and developing workplans to include conferences for outreach. Their workplan offers the ability to establish key messages throughout the ecological community.

Group Research Mentors

Dr. Rebekah Kading (Colorado State University)
Dr. Keti Sidamonidze (NCDC, Georgia) *– note: ordinarily works in Group 2*
Dr. Paul Cryan (USGS Fort Collins Science Center) *– note: invited, could not attend*
Dr. Tigga Kingston (Texas Tech University) *– note: invited, could not attend*
Dr. Robert Kityo (Makerere University, Uganda) *– note: invited, could not attend*

Group 4: Human-Bat Interactions

Group 4: Human-Bat Interactions **Focus Area 1:** Human behavioral risk characterization **Focus Area 2:** Hunting and commodity chain (e.g. bushmeat, guano, and pet trade) **Focus Area 3:** Ecotourism **Focus Area 4:** Interactions in human dwellings	
MISSION STATEMENT: Characterize relationships and interactions between bats and humans and communicate findings to key stakeholders and communities.	
Objective 1	Identify and characterize high-risk interfaces
Objective 2	Develop risk maps to assess existing data and validate risks
Objective 3	Communicate findings to key stakeholders
Objective 4	Develop and test policy interventions for specific human bat interfaces
Projects or Activities	**Timeline / Responsible Authority / Needs (e.g., funding or other support)**
Convene a series of funders' meetings	Timeline: 12 months Needs: Assessment of available funders and timeline of BOHRN projects needing funding Funding platform on BOHRN website
Conduct survey that identifies risk groups and interfaces	Timeline: 12 months Needs: Literature assessment of current risk groups and interfaces
Develop risk map	Timeline: 12 – 36 months Needs: Literature review Research assistance
Conduct literature / research review	Timeline: 6 months Needs: Research assistance
Create a database of expertise, active research projects and activities	Timeline: 36 months Needs: Funding for database creation Development of platform on BOHRN website
Perform a seasonality study	Timeline: 36 months Needs: Research assistance Funding

Group Notes
Group 4 focused on a series of projects that would help assess the risk groups and characterize the interactions between bats and humans. Long-term the group's focus is to develop a way to effectively communicate these findings to stakeholders and the community

Group Research Mentors
Dr. Ian Mendenhall (Duke-NUS)
Dr. Supaporn Wacharapluesadee (WHO CC, King Chulalongkorn Medical Hospital, Thailand)
Dr. Nesreen Alhmoud (Royal Scientific Society, Jordan) *– note: worked in Group 3*

Dr. Kevin Olival (EcoHealth Alliance) *– note: invited, could not attend*

Participant Feedback

After the June BOHRN event, participants were asked to give feedback via SurveyMonkey to the following questions:

1. Do you think the objectives for the 20-21 June BOHRN meeting where achieved? Please explain your answer.
2. Do you wish we did anything differently?
3. What objectives do you think we should cover at our November meeting?
4. Are your working group's objectives and timelines clear? Do you think you will be able to accomplish the objectives outlined over the next year? Please explain why or why not.
5. Will you be able to attend the BOHRN and International Meeting on Emerging Disease and Surveillance in Vienna, Austria on 9 – 12 November?

Of the participants who responded, there was an overwhelmingly positive response to the two-day BOHRN meeting. All participants answered that they felt the meeting met its set objectives and nothing was noted to change for future meetings. Participants are able to attend the November IMED and BOHRN meetings. For the November meeting, responses indicated that the steering committee would like to review progress updates, readouts from the September event, and design an approach for outreach and communication. In addition, responses indicated the need to engage with other donors prior to IMED. It was suggested to hold "a side meeting with key steering committee members and funders to discuss needs and interest in joint activities with DTRA." To facilitate this discussion, it was suggested that a survey of U.S. and International donors be summarized prior to the November meeting.

Annotated Action Items

The following Action Items were recorded and compiled by the organization and administrative support staff of CBEP / Executive Committee for BOHRN.

Description		Approach for Completion (with suspense dates)	Responsible Point of Contact
Action 1	Collect information on BOHRN SC bios and ideas on BOHRN messaging for website	July 2018	GSE
Action 2	Create task list for each working group	July 2018	GSE
Action 3	Update BOHRN website messaging and tools	August 2018	GSE
Action 4	Literature review scoping	October 2018	BOHRN working groups led by Rebekah Kading, Kevin Olival, Paul Cryan and Tigga Kingston
Action 5	Collect status and assessments of Working Group action items prior to November meeting	October 2018	GSE
Action 6	Develop action items and agenda using suggestions from BOHRN SC for November IMED conference and BOHRN meeting	October 2018	DTRA and GSE
Action 7	Begin messaging and outlining Uganda BTCD	October / November 2018	DTRA, GSE, Rebekah Kading and Robert Kityo

BOHRN – International Meeting on Emerging Diseases and Surveillance

During the BOHRN meeting, the steering committee voted on options for the next full BOHRN meeting. Several conferences in October – December 2018 were suggested. The group decided that the objectives for the International Meeting on Emerging Diseases and Surveillance (IMED) best met the overall goals of BOHRN. IMED is organized by the International Society for Infectious Diseases and will take place in Vienna, Austria from 9 – 12 November 2018. The conference draft agenda reviews the following objectives: methods and models of disease surveillance, detection and prediction, lessons from epidemic emerging zoonoses, animal health threats biosecurity, agents of bioterrorism and biological warfare infections, and migration of human and animal vector borne diseases. The meeting aims to unite human, veterinary, and environmental specialists on approaches to pathogens in a broad ecological context. These goals align directly to the BOHRN objectives and provide opportunities for the steering committee to socialize the network while gaining tools and information from the interdisciplinary collaboration to aid in accomplishing the working group actions

The BORHN steering committee agreed upon a two-day meeting around IMED. The following objectives are suggested:

1. Prioritizes funding needs based on working groups' characterization of gaps and needs, to help organize and develop funding initiatives; and
2. Analyze progress of action plans and their yields establishing collaborate and sustainable projects

The following items are topics for discussion during the meeting:

- Draft initial Request for Approvals
- Develop initiatives for a funding discussion
- Review and begin developing abstracts for working group actions
- Discuss literature review scoping
- Plan and draft agenda for Uganda Training Event
- Read out from Georgia Biological Threat Characterization Discussion (BTCD)
- Identify and catalog existing tool kits for website database
- Develop an approach to outreach and populating working groups
- Report out of working group progress
- Strategy session for future International bat meeting and conferences

Annex A: BOHRN Saskatoon Meeting Agenda

Day 1 – 20 June 2018 (Wednesday)

- 1000 – 1045 Welcoming Remarks
- 1045 – 1100 House Keeping and Admin
- 1100 – 1130 Updates on BOHRN
- 1130 – 1145 Working Break
- 1145 – 1300 Current Research and Interest – Quad Chart Presentations
- 1300 – 1400 Lunch
- 1400 – 1600 Breakout Sessions
- 1500 – 1530 Working Break
- 1600 – 1630 Brief-out of Breakout Sessions
- 1630 – 1645 Close-out Discussion

Day 2 – 21 June 2018 (Thursday)

- 0900 – 1000 Review of Day 1 / BOHRN timeline
- 1000 – 1030 Large Group Discussion – BOHRN Website
- 1030 – 1045 Working Break
- 1045 – 1145 Network Analysis
- 1145 – 1215 Lunch
- 1215 – 1315 Biological Threat Characterization Discussion
- 1315 – 1345 Lugar Center Presentation
- 1345 – 1415 Large Group BTCD Q&A
- 1415 – 1430 Working Break
- 1430 – 1500 Build Next Meeting Agenda
- 1500 – 1600 Next Steps

Annex B: BOHRN Saskatoon Meeting Participants

STEERING COMMITTEE MEETING INVITEES, DID ATTEND		
Mendenhall	Ian	Duke-NUS, Singapore

Hudson	Megan	GSE

Annex C: Research Quad Charts

EcoHealth Alliance

Dr. Jon Epstein presented on pandemic prevention and disease ecology. Stating there is very little to our current understanding about host-pathogen relationships and the species involved in maintaining zoonotic viruses in nature. However, studying viral pathogens in wildlife is logistically challenging therefore, they are taking a multidisciplinary approach in study locations. PREDICT's impact has helped strengthen lab networks and regional surveillance networks for disease detection.

TECHNICAL DESCRIPTION AND OBJECTIVES

Pandemic prevention / Disease Ecology
Challenges: Most emerging viral pathogens come from wildlife - especially bats. Studying viral pathogens in wildlife is logistically challenging and requires intensive, long-term efforts and specific technical expertise to obtain meaningful data and conduct analyses.
Current state of understanding: Very little is understood about the host-pathogen relationship and the species involved in maintaining zoonotic viruses in nature.

APPROACH

- Multidisciplinary, collaborative teams including local experts in the study location, coupled with capacity building has been an effective approach to conducting research on zoonotic pathogens *in situ*.
- Identifying strong scientific partners and relevant govt agencies with whom to partner is essential. Local scientists lead the research, with collaborative input and support from EHA's core staff scientists. Consistent communication with partners, and updates to govt. entities maintains positive relationships and validates the work.
- The most important tool, and often least available is technical expertise to safely and effectively work with wildlife. This requires specialized training. Lab capacity to safely detect pathogens and antibodies is also essential.

MILESTONES, SCHEDULE, AND STATUS

Research is ongoing and reflects several major projects:
e.g. USAID PREDICT (through Oct 2019)
DTRA CBEP project in Malaysia (through 2022)
PREDICT began in 2009, and is led by a consortium of institutions operating in 26 countries. To date, it has detected more than 1,000 new viruses and trained members of the human and animal workforce to use a One Health approach to detect viruses in wildlife, livestock, and humans and focus surveillance activities in locations of high risk for spillover.
SARS-CoV in China – studying risk of SARS and SARS-related CoVs In rural and urban China. (through 2019).

IMPACT

PREDICT has trained thousands of scientists and govt officials in 30 countries to be better able to detect and respond to potential pandemic threats. Laboratory capacity has been enhanced in more than 30 labs, field expertise developed, and policies impacted by PREDICT activities. EHA has been part of the development of the One Health Secretariat in Bangladesh – an official body that includes representation from the ministries of health, agriculture, and environment as well as additional stakeholders and that convenes regularly to discuss and implement surveillance and outbreak response activities for zoonoses.
Globally and regionally, PREDICT has helped strengthen lab networks and regional surveillance networks for disease detection. Example: ebola host project (PREDICT) in Liberia, Sierra Leone, and Guinea - coordinated surveillance for Ebola reservoirs.

Duke-National University Singapore

Dr. Ian Mendenhall presented on his research to inform and improve biosurveillance to more effectively use resources. Through surveying bats and small mammals across Cambodia and India the study aims to increase the understanding of disease ecology and detect evidence of spillover to humans, characterize parasite communities, and develop predictive host, ectoparasites and virus/bacteria. The study aims to help detect spillover from bats to humans in India and develop predictive maps in Cambodia.

TECHNICAL DESCRIPTION AND OBJECTIVES

The research I conduct is to inform and improve biosurveillance to more efficaciously use resources. We are surveying bats and small mammals across Cambodia and in India to understand the disease ecology of these systems and detect evidence of spillover to humans, characterize parasite communities, and develop predictive host, ectoparasite and virus/bacteria.

This work is labor intensive and often is performed in difficult to reach areas. The coordination with local agencies is key for obtaining permission. We don't have a great way to age a bat or determine if a bat is sick.

On a global scale, we understand what variables are associated expected presence and emergence. Shedding appears locally influenced (age/ gender, partuition peaks)

APPROACH

India: Studying an annual bat harvest in a remote part of India to understand risk of spillover
Difficulty reaching site and maintaining cold chain (car breakdowns)
Obtain permission from village council
Building capacity in a conservation genetics lab
Difficulty in timely ordering of reagents
Permits to ship samples overseas
Cambodia: Develop predictive maps for bat/small mammal/ectoparasite/virus & bacteria
As this is a randomly selected model, some points are difficult to access
Pseudoreplicate
Acoustic call library
Difficulty in timely ordering of reagents
Landscape change & access to maps

MILESTONES, SCHEDULE, AND STATUS

All delayed due to legal contracts, transfer of funds, and delays in purchasing reagents
India: Two year project. Originally wanted to sample before and after harvest, but logistically unfeasible

- Visited for 2 harvests. Have large sample bank. Serology complete. NGS logistics is difficult
- Plan to visit this harvest in 2018

Cambodia: Sampled in every province. Running preliminary models to tell us how many sites we need to visit. Setting up lab in July where we will begin testing samples (delays in ordering)

IMPACT

India: If we can detect spillover to humans directly from bats (same population of humans and same species of bats)

- Develop lab tools to see if these are occurring in other sites (specifically Cambodia and Singapore)
- Provide information campaign and PPE for bat harvesters, in addition to using harp trap for more sustainable harvest

Cambodia: Develop predictive maps and see if these can be validated. If this approach works, it would be beneficial to beta-test in the greater Mekong. Can we determine mappable attributes associated with the presence of absence of organisms of interest

Colorado State University

Dr. Rebekah Kading presented her labs work on investigating the role of bats as reservoirs in arbovirus transmission cycles. Through a multidisciplinary approach this study includes work on viral disease pathogenesis, molecular characterization, ecology, and biosurveillance. The study aims to characterize novel molecular, virological, and field data on bat associated orbiviruses and bat disease response to foreign pathogens.

TECHNICAL DESCRIPTION AND OBJECTIVES

My lab is investigating the role of bats as reservoirs in arbovirus transmission cycles. Our multidisciplinary approach includes studies on viral disease pathogenesis, molecular characterization, ecology, and biosurveillance. Currently we are studying bat-associated orbiviruses, including Bukakata orbivirus, isolated from an Egyptian rousette bat in Uganda.

1. Underlying challenges
   - Reagent and assay development for studying new viruses; need *in vitro* and *in vivo* model systems
2. Current state of understanding (=poor)
   - Mosquitoes feed on bats
   - Arboviruses isolated from naturally-infected bats
   - Some seroprevalence data available
   - Overall: field and experimental data are sparse

APPROACH

Specific aims:
1. Characterize clinical disease manifestations, virus shedding patterns, and immune kinetics of Bukakata orbivirus infection in Jamaican fruit bats (*Artibeus jamaicensis*)
2. Assess the reassortment potential of tick-borne orbiviruses in vector and vertebrate cell lines
3. Investigate the prevalence of Bukakata orbivirus exposure in bat, tick, and human populations in Uganda

Challenges: assay development and positive controls; tick cell line establishment; high-throughput assessment of reassortment among 10-segmented viruses
Key steps: model system development; reagents and approvals; sample collection and testing; analysis and interpretation
Tools and technology: IHC, qRT-PCR, ddPCR, cell culture, IFA, NGS

MILESTONES, SCHEDULE, AND STATUS

1. Timeline for delivery
   - Aim 1: Spring 2019
   - Aim 2: Fall 2019
   - Aim 3: Spring 2020 or earlier
2. Project status
   - Aim 1: infections completed; samples still to be tested
   - Aim 2: to begin this summer
   - Aim 3: additional bat, tick, and human samples available but not yet tested; qRT-PCR assay optimized

Colorado State University
Rebekah Kading, PhD

IMPACT

1. Quantitative
   - Publications: at least 1 manuscript per aim; another on Bukakata virus discovery and molecular and *in vitro* characterization
   - Grant proposals
     - Bat disease response observed for Bukakata virus in JFBs – continued studies planned on pathogenesis
     - Role of orbivirus reassortment on emergence and zoonotic potential
     - Continued field studies and biosurveillance capacity building efforts
2. Regional and global – novel molecular, virological and field data on bat-associated orbiviruses. Bat disease response to a foreign pathogen.

National Center for Disease Control and Public Health, Georgia

Dr. Lela Urushadze, Dr. Tamar Kutateladze, and Dr. Keti Sidamonidze presented on their research of understanding the risk of bat borne zoonotic disease emergence in Western Asia, molecular epidemiology and phylogenetic analysis of zoonotic pathogens in Georgian bats, and the assessment of emerging pathogens from bats in Ukraine and Georgia. The research highlights several key points to include that bats in Georgia are vulnerable to several bacterial pathogens and may play an important role in maintaining those agents in nature. The research aims to help assess the pathogen diversity in bat populations and their role in the transmission of zoonotic infections to humans.

TECHNICAL DESCRIPTION AND OBJECTIVES

1. I am Key person of Project "Understanding the Risk of Bat-Borne Zoonotic Disease Emergence in Western Asia" from Georgian side.
2. My PHD is about, "Molecular epidemiology and phylogenetic analyze zoonotic pathogens in Georgian bats"
3. Working on project "Assessment of Emerging Pathogens From Bats in Ukraine and Georgia"
4. Working on project "Risk of infection from insectivorous bat borne viruses in incidental hosts: comparative phylogeography of filoviruses, coronaviruses, and paramyxoviruses in the Philippines and the Country of Georgia"

APPROACH

1. Workshops for bats sampling, Trap and collection non-lethal specimens from bats and associated ecological data, Test specimens for CoVs via PCR at regional labs; sequence positive specimens in Georgia.
2. Collection, description and analyses all data what was done from 2012 till today for bat borne pathogens research in Georgia.
3. According the reviewers comments we are working on new version for abstract, because It is would be first study for bat borne pathogens in Ukraine. For Georgia project would be beneficial according the data what we have under preliminary research, but further studies need to be carried out to understand the importance of these agents in both public health and animal health.
4. Due to reviewer's suggestions, we are participating for rewriting abstract for the DTRA BAA. Ten roosts in the Georgia will be monitored every month, including human structures and caves in both countries that are permanently occupied by insectivorous bat species

MILESTONES, SCHEDULE, AND STATUS

1. Characterization of bat coronaviruses (CoV) across Western Asia

   Analyze and map bat pathogen spillover risk by including broader, regional ecological data- ongoing project, first year
2. Day of Dissertation defense July 5th 2018.
3. Working on new version of abstract for resubmission for DTRA BAA- for September 2018
4. Resubmission process of abstract for DTRA BAA- for September 2018

IMPACT

1. Participation for establishment Western Asia Bat Research Network (WAB-Net) Improvement local capacity for zoonotic disease investigations and early detection from Georgian side
2. I concluded, that bats from Georgia are vulnerable to several bacterial pathogens. These data highlighted that bats may play important role in maintaining those agents in nature.
3. Project will help to assessment of the pathogen diversity in bat populations of Ukraine and Georgia, to determine their role on the transmission of potentially zoonotic infectious diseases to humans; characterization of the novel viruses and bacteria from Insectivorous Bats in Ukraine and Georgia; development of a risk assessment framework for both countries.
4. Due to the fact that these countries share many of the same genera of insectivorous bats and are species rich. This project will provide data on bat-borne virus epidemiology in tropical (Philippines) and temperate sites (Georgia) drivers .

WHO CC for Research and Training in Viral Zoonoses, King Chulalongkorn Memorial Hospital

Dr. Supaporn Wacharapluesadee explained her work to assess and mitigate the risk of bat borne pathogens to communities. By conducting a systemic and longitudinal surveillance to address the internal and external factors that enhance infectivity in bats and conducting serosurveillance in multiple bat borne pathogens and bat species, the study will be able to better understand the risk of bat borne pathogens and educate communities.

TECHNICAL DESCRIPTION AND OBJECTIVES

Underlying Challenge

- Seasonal prevalence of Coronavirus (CoV) in Wrinkle-lipped free-tailed bat (*Chaerephon plicata*)
- Bat borne viral pathogens and risk to the communities; people in the community are unaware (PREDICT project)
- Serology study of bat borne pathogens in Thailand needed

Current State of Understanding

- MERS-related CoV was found in *C. plicata* in certain months in Thailand
- There is a relationship between virus and host species and/or geography
- No education of villagers at-risk from infection of bat viruses; no tools in place to help prevention of infection
- Lack of serology data on new bat borne viral pathogens in Thailand; only Nipah and Ebola have been studied

APPROACH

What can be done to address the challenges?

- Conduct a systemic and longitudinal surveillance to address the internal and external factors that enhance infectivity in bats
- Educate communities with continued workshops and evaluation
- Conduct serosurveillance in multiple bat borne pathogens and bat species

What are the key steps along the way

- Identify and prioritize pathogens of interest and its reservoir
- Identify the key factors involved in the viral infection
- Create tools (education and prevention tools) for implementing in the communities at-risk from bat infection

What tools and technologies are needed to address the challenges?

- Diagnostic tools: serology, molecular, NGS, viral isolation
- Prevention tools: guidebook, innovative instrument

MILESTONES, SCHEDULE, AND STATUS

Delivery	Q3Y 18	Q1Y 19	Q2Y 19	Q3Y 19
Knowledge of CoV's seasonal prevalence	x			
Finding bat borne viral pathogens	x	x	x	x
Identify preliminary factor(s) that facilitate infection		x	x	x
Risk behaviors/ culture of community	x	x	x	x
Serological data			x	x
Deeper viral characterizations such as NGS and isolation		x	x	x

Project name	Status
CoV seasonal prevalence	Collection and Testing completed
PREDICT project	Sample collection will be completed in July 2018, testing to continue
Serology	Project will start July 2018

IMPACT

Define the quantitative impact of project.

- New knowledge that will be lead to the development of a guideline to detect, control, and prevent an outbreak of bat borne pathogens
- Implementation tool or strategy to help prevent infection from bats at the community level
- Community levels to learn how to prevent infection and spread of bat borne pathogens

Define the regional and global impact.

- Regional networking to share and support training and knowledge acquired
- Knowledge to prevent spread and identify hot spots globally

Will this lead to the need for future studies?

Yes, several factors related to the infectivity of virus in bats are unclear and needs more studies, both natural infection and an animal model studies.

Research Institute for Tropical Medicine, Philippines

Dr. Catalino Demetria presented on his proposed research on bat assay development. He then presented on his current research on the Dengue vaccine to improve the surveillance data of other Flaviruese that are mistaken for Dengue and to provide tools to determine if the vaccine have seroconverted and to determine the serostatus of the population.

TECHNICAL DESCRIPTION AND OBJECTIVES

The research is about development of new serological test in the light of CYD dengue vaccine controversy in the Philippines. The new test aims to distinguish between vaccine induced antibodies from wild type strain. One of the challenges is having around 80% seroprevalence of dengue IgG in the Population. Previous research shows that vaccine induced antibodies are not reactive to ELISAs using NS1 antigens since this is not a component of the chimeric vaccine. The vaccine has gene encoding NS1 from yellow fever virus which served as the backbone of the chimeric vaccine.

APPROACH

Develop a multiplex bead -based assay that will be able to differentiate between naturally acquired antibodies from vaccine induced. The research will make use of Luminex technology's strength which is multiplexing. The panel will include Dengue serotypes 1-4 for both envelope protein and NS1, Zika virus, Jap E., Yellow Fever Virus and Chikungunya virus. This will also improve surveillance data for the other Flaviviruses.

MILESTONES, SCHEDULE, AND STATUS

The project is expected to be finished in 30 months. Deliverables include a working assay.

IMPACT

The research will be able try to accomplish the following;
- Provide a tool to determine if vaccinees have seroconverted or not
- Improve surveillance data of other Flaviruese and Chikungunya virus which is often clinically mistaken for Dengue
- Provide a tool to determine the serostatus of the population

Royal Scientific Society, Jordan

Dr. Nesreen Alhmoud presented on understanding the risk of bat-borne zoonotic diseases emergence in Western Asia. This research project is in collaboration with the National Center for Disease Control and Public Health in Georgia. The research aims to characterize bat coronaviruses across Western Asia, analyze and map bat borne pathogen spillover risk, and create a collaborative Western Asia Bat Research Network.

TECHNICAL DESCRIPTION AND OBJECTIVES

Understanding the Risk of Bat-Borne Zoonotic Disease Emergence in Western Asia

Current research on the distribution of bats, diversity of their viruses, and potential for zoonotic disease emergence in Western Asia is severely limited.

To fill this gap and contribute to biological threat reduction, the project proposes a hypothesis-driven One Health research project focused on *characterizing bat coronavirus diversity and the risk of bat-borne zoonotic disease emergence*.

APPROACH

Objective 1: Characterize bat coronaviruses (CoV) across Western Asia; this will include

- extensive nonlethal field sampling of bats,
- screening and characterization of viruses from bat specimens (Jordan, Georgia Pakistan & Turkey)

Objective 2: Analyze and map bat pathogen spillover risk by including broader, regional ecological data

Objective 3: Creation of a collaborative Western Asia Bat Research Network (WAB-Net) – including key researchers and public health representatives from >12 countries

- Annual workshop
- Hands on Training – Research Exchanges

MILESTONES, SCHEDULE, AND STATUS

Timeline

October 2017 – January 2022

Year 1 (October 2017-September 2018)

- Task 1: Establish robust scientific research platform to understand zoonotic disease risk in Western Asia.
- Task 2: Bat specimen and disease ecology field data collection.
- Task 3: Regional bat coronavirus characterization.
- Task 4: Compile and disseminate research results and reports to stakeholders.

Jordan:

Field Sampling: July 2018

IMPACT

Regionally:

- The RSS Center will act as a liaison between WAB-Net and other regional networks.
- The RSS Center will serve as a regional hub for laboratory research and training.

Globally:

The integrated approach of the project presents a coordinated strategy to advance scientific knowledge around transboundary zoonotic disease emergence risk in Western Asia to inform early detection, diagnosis, and response to support the Global Health Security Agenda and CBEP goals.

Annex D: Recommendations for CBEP

The BOHRN meeting in Saskatoon provided a forum for productive discussions regarding potential research activities and projects; however, it also highlighted the need to expand the network to include other sources of funding for its sustainment. GSE submits the following recommendations to CBEP to both broaden the network and ensure it meets its objectives. These recommendations are designed to provide a roadmap to develop enduring capabilities for BOHRN.

Recommendation 1: Engage Other Interested Funding Sources

GSE proposes a step-wise approach to engaging other interested funding sources. This approach aims to provide a forum for collaboration within and across DoD agencies. By taking this approach, CBEP and the steering committee will be able to align projected projects and research within DoD interest.

Step 1: Convene a meeting for USG Funding Sources, including the following departments and organizations (at a minimum):

- RD CB (JSTO)
- USAMRIID
- AFHSB
- NIH NIAID
- DARPA

This meeting could include the following objectives (1) gain buy-in on BOHRN objectives and end states; (2) outline funding departments' equities and trends, mechanisms, timelines, and active projects; and (3) discuss alignment opportunities (mechanisms) and challenges.

Step 2: Convene a meeting for both USG funders and International Funders. To further BOHRN's capabilities, projects and overall outreach, an additional group of funders outside of DoD need to be included. This should include the following (at a minimum):

Convene Funders / Researchers Meeting

- BOHRN Members
- USG Funding Sources
- NGOs

A funders meeting could include the following objectives (1) gain buy-in on BOHRN objectives and end states; (2) outline funding departments' equities and trends, mechanisms, timelines, and active projects; and (3) discuss alignment opportunities (mechanisms) and challenges.

Recommendation 2: CBEP Coordinate on an Request for Information or Proposal with other Partners

GSE suggest that CBEP encourage BOHRN SC members to develop abstracts in-line with Focus Areas to support the development of program Unfunded Requirements (UFRs), Requests for Information, or Request for Proposals. In addition to fulfilling objectives of BOHRN, CBEP should shape these documents to answer force protection benefits for bat research, coordination with DTRA RD CB and/or global capability gaps for bat-borne pathogen threats assigned by other USG and NGO funding sources. By developing these requirements, CBEP will be able to assess its ability to commit to the working group projects within the scope of the DTRA mission. Requirements developed by CBEP will help outline the needs for additional funders for specific focus areas.

Recommendation 2 requirements:

- Analyze fund mapping application for bat migration patterns and overlays for human populations, pro-med data for fevers of unknown origin

- Write a STEP TD for BOHRN

Recommendation 3: Support Attendance to Relevant Training Events

GSE recommends the continual support of BOHRN members to attend relevant training events. By increasing the experience through training, BOHRN members will be able to improve and develop skills to better aid in the working group task. This will help BOHRN to meet its overall objectives. In addition, these trainings and conferences help socialize BOHRN to a new individuals and bat networks. This will help BOHRN develop its regional working groups and connect with existing networks.

GSE recommends the following workshops as examples of training events. In addition, partnerships with universities for developing and participating in future trainings should be considered:

- US Davis Galaxy Training Workshop http://bioinformatics.ucdavis.edu/training/
- Harvard Bioinformatics Workshops https://catalyst.harvard.edu/services/bioinformatics-workshops/

Subject: Expert judgement for SARS-CoV-2 risk assessment for North American bats
Attachment(s): "Assessing the Risks Posed by SARS CoV. intro Elicitation v2.docx","BatEE Practice Questions v2.xlsx"

Hello experts,

Thank you for volunteering your time and expertise to help estimate the risk of SARS-CoV-2 to North American bats. Mike Runge and I (Evan Grant), with the U.S. Geological Survey Patuxent Wildlife Research Center, are facilitating this effort in collaboration with the USGS National Wildlife Health Center, USGS Fort Collins Science Center, USFWS, and EcoHealth Alliance. We are conducting a rapid assessment of the risks for transmission of SARS-CoV-2 from humans to bats. The goal is to provide scientific information that will guide wildlife management agency response to this potential risk, including development of management recommendations and mitigation strategies.

Attached please find two documents: (1) an introduction to expert elicitation with some background on the issue we are addressing, and (2) a spreadsheet <BatEE Practice Questions v2.xlsx> with calibration questions. There are three tabs (corresponding to the three questions) in the accompanying spreadsheet, and a fourth tab that summarizes the responses and the calculated mean and standard deviation for each question.

We have a very tight timeline to provide guidance to U.S. management agencies, so we thank you for your participation along the following timeline:

i. Respond to ehgrant with your responses to the calibration questions in the attached spreadsheet (due by 12 PM ET 10 Apr)
ii. Review the background information and elicitation questions (we will send these additional documents to you by 6 pm ET 10 Apr)
iii. Respond with your initial responses to the questions (due by 6 PM ET 13 Apr)
iv. Be available for a 2-hr conference call to discuss initial responses and share insights (4 PM ET 14 Apr – and/or – 4 PM ET 15 Apr)
v. Revise and send your second-round responses to the questions (due 24 hours after the last conference call)

Thank you in advance for your participation. If you have questions – please contact Evan .

Kindest regards,
Evan and Mike

Assessing the Risks Posed by SARS CoV-2 in and via North American Bats
A Rapid Decision and Risk Assessment

Introduction to Expert Elicitation for an Expert Panel

Evan Grant*, Mike Runge
U.S. Geological Survey Patuxent Wildlife Research Center
*Correspondence: ehgrant@usgs.gov
09 April 2020

Introduction

The novel betacoronavirus, SARS-CoV-2, that has caused a pandemic disease in humans, arose from a mammalian host, possibly Old-World bats in the family *Rhinolophidae*; the closest known virus discovered in wildlife was found in a horseshoe bat (*Rhinolopus affinis*) from Yunnan province in China (Zhou et al. 2000). No SARS-related betacoronaviruses have yet been identified in New-World bats, but a different type of betacoronavirus has been identified in a New-World bat from Mexico (Anthony et al. 2013). This raises an important question about whether North and South American bats could be vulnerable to infection with SARS-CoV-2, via contact with humans, which in turn raises questions about whether there may be reciprocal spread to humans via a bat reservoir. This inquiry is designed to be a rapid assessment of the risk of transmission of SARS-CoV-2 from humans to North American bats, the management contexts in which this risk might be relevant, and an assessment of possible mitigation actions that may be implemented by those who come into contact with bats or their habitats.

Justification for an expert elicitation

Ideally, we would obtain parameter estimates from empirical data and associated mathematical models. Because these information are unavailable and time is of the essence for decision makers, we aim to use an expert panel to elicit parameter values with associated uncertainty, using techniques of expert judgment that utilize best available scientific information, account for uncertainty, and reduce bias (Morgan 2014, Sutherland and Burgman 2015).

Expert elicitation is a formal, structured process of obtaining expert judgment for specific questions. An expert is someone who possesses substantive information on a particular topic that is not widely known by others. We know that experts have knowledge, often privileged knowledge, that accrues as a result of their research and experience, even about processes for which data have not been collected. The question is how to extract that knowledge accurately and precisely. Expert judgment is a quantitative expression of an expert's belief based on knowledge and experience; it is an informed belief. Expert elicitation can provide improved information over single-expert inquiry when a diverse group of experts is asked to provide estimates, using a facilitated approach with discrete opportunities for information sharing, provision of estimates, and review of summarized information (Martin et al. 2012). Expert elicitation, when conducted with the same level of rigor as the collection and use of empirical data, can result in reliable predictions (e.g., O'Hagan et al. 2006, Speirs-Bridge et al. 2010, Runge et al. 2011, Martin et al. 2012, Adams-Hosking et al. 2016).

An expert elicitation is governed by specific protocols to avoid inherent biases resulting from cognitive traps. These cognitive traps are shortcuts, or heuristics, that serve us well for simple decisions but result in biased estimates for more complex tasks (O'Hagan 2019). These biases include:

- Availability bias (experts will be influenced by evidence or events that are easily recalled)
- Anchoring bias (experts fail to consider possible values far from an initial estimate)
- Overconfidence (experts tend to underestimate their uncertainty, and make forecasts that are too narrow)
- Representativeness bias (a tendency to think of probabilities related to readily-available examples)
- Motivational bias (an innate desire to further our own interests)

When the number of experts is limited, we would additionally be concerned about small-sample bias.

There are additional biases that arise through the behavior of groups. To some extent, these can be collectively referred to as "groupthink", the tendency for groups to converge too quickly on consensus estimates or decisions and to ignore or forget divergent views that are held my members of the group. In this way, groups of experts can be collectively overconfident, or even biased.

So, the methodological challenge of expert judgment is to reliably extract the desired information from each member of a group of experts, without falling into the cognitive and behavioral biases that can undermine such an exercise. The best practices in an expert judgment approach have evolved by considering this challenge, testing approaches via experiments, and recommending a set of protocols for conducting an expert elicitation.

Steps in an elicitation

We are using a protocol based on a modified Delphi method called the IDEA protocol (Hanea et al. 2017), with the four-point elicitation method (Speirs-Bridge et al. 2010). There are six steps in the process:

1) Select experts
2) Calibrate experts (seed questions and sharing available information)
3) Elicitation of parameter values (4-point method)
4) Summary, review, and discussion (aimed at reducing linguistic uncertainty – relating to the instructions – and sharing insights, not to reach consensus)
5) Experts revise their initial values (if desired)
6) Aggregate information across experts

Steps 3-6 comprise a modified Delphi approach (described below).

Selection of experts

Experts are individuals with specific subject-matter experience and knowledge. Experts should have relevant expertise which may come from formal training and be demonstrated by

professional accomplishments such as peer-reviewed publications, familiarity with and knowledge of the system or related systems, willingness to participate fully and impartially in an elicitation process, and good interpersonal and communication skills (Ayyub 2001, Fazey et al., 2006).

Groups of experts have been found to perform as well (in terms of providing information close to the true empirically observed data) as more specific experts (e.g., Burgman et al. 2011). The expert panel should be diverse – possessing knowledge of North American bats, zoonotic disease, and possible mitigation strategies; representing multiple institutions, specialization, and gender. The optimal number of experts for a structured elicitation is between 5 and 12, with decreasing marginal benefit after 12 experts (Hogarth 1978, Hemming et al. 2018).

Calibration questions

Before starting the elicitation concerning the questions of interest, we will provide the expert panel a chance to practice the elicitation methods. We will provide questions that are known (i.e., we have identified values from the literature, but are unlikely to be known precisely by experts). We use these questions to ensure that the instructions are understood by experts, and to allow experts a chance to calibrate their estimates of uncertainty.

Three questions are listed below (see accompanying spreadsheet < BatEE Practice Questions v2.xlsx>). For each question, we ask experts to provide four responses: an estimate that represents your view of the lowest reasonable value; an estimate of the highest reasonable value; an estimate that represents the best central value; and your confidence that the true value lies within the low and high values that you have provided. We have attached a spreadsheet in which you can enter these values; the spreadsheet automatically calculates a probability distribution that represents your uncertainty, as immediate feedback about whether your responses reflect your expert belief. This is a "closed book" exercise (we ask that you do not check this information in books or online). Please return your answers to us; we will use them to provide feedback to the group about your individual and collective accuracy and precision; as a means of allowing you to calibrate your thinking process prior to the elicitation for the questions of central importance.

The calibration questions are:

1) What is the mean forearm length (in centimeters) of an adult little brown bat (*Myotis lucifugus*)?

2) What is the average number of subsequent white-nose syndrome infections resulting from a single infected little brown bat (i.e., R_0)?

3) In a population that has already experienced decline due to WNS, out of 100 adult female little brown bats, how many would you expect to breed in a given year?

Elicitation of parameters using a modified Delphi approach

To generate empirical estimates of each parameter, we use a '4-point' elicitation method. This approach has been shown to reduce overconfidence in experts (Speirs-Bridge et al. 2010) and can generate a quantitative estimate from experts who may be uncomfortable providing

estimates. We derive a median and credible interval for each parameter from the following four questions:

1) Realistically, what is the lowest reasonable value for the parameter?
2) Realistically, what is the highest reasonable value for the parameter?
3) Realistically, what is the most likely reasonable value (i.e., your best estimate) for the parameter?
4) How confident are you that the true value is between the lowest and highest values you provided?

We then assume that the most likely value is the median value, and combine the upper and lower estimates and the reported confidence to generate a credible interval.

Experts provide their estimates anonymously, and summaries are provided that maintain anonymity, to avoid biases associated with group thinking and dominant personalities. Experts are encouraged to discuss the information during a facilitated discussion of the summarized data, after which experts have the opportunity to revise any of their estimates.

The modified Delphi sequence (independent-group-independent) is important to preserve the unique insights help by individuals while at the same time allowing the benefit of wisdom to be shared. By asking experts to perform the first estimate independently, their own personal views are captured. By allowing the expert to share and discuss their initial estimates, we can explore whether there is residual linguistic uncertainty that needs to be corrected and we can allow insights to be shared across experts. By allowing the final estimates to be made independently, we guard against dominant voices in the group and retain the diversity of insights among the experts.

Aggregation of information across experts

Following the elicitation, we will aggregate the results to produce a single probability distribution that represents an estimate, with uncertainty, for each parameter. To do this, we will first transform the four-point elicitation results into a probability distribution for each expert. We will then average these probability distributions across experts, with equal weighting. (There are involved methods for weighting experts based on sets of calibration questions, but we are both skeptical of these methods and limited on time).

Assessing the Risks Posed by SARS-CoV-2 in and via North American Bats

Expert Elicitation, Discussion after Round 1

16 April 2020

Key insights/clarifications from discussion:

Questions 1-3, regarding research, survey, monitoring, and management (RSM):

Consider the number exposed by each member of a research team, but we're looking at individual (per-human) exposure while conducting each of the activities. We assume that individuals conducting research are: asymptomatic, but actively shedding a sufficient amount of virus that may lead to infection of a little brown bat

Q1: The description of typical handling procedures for researchers working with bats (handling of LBB typical of other species: LBB occur in colonies with other species) includes:

1) Duration of contact 1-2 min per bat
2) Holding bat within 12 inches of face
3) Take measurements
4) Sexing (blowing on bats)
5) Discouraging biting (blowing on bats)

Q2: the definition of enclosed space:

1) Includes caves, mines
2) Various sizes and morphologies – variation among sites in airflow
3) Activity in enclosed space may be 1hr+
4) Mixture of bats that are stationary (roosting) and in flight

Q3: Typical activities that are within 6 ft but **not** in an enclosed space:

1) Typically, the management agency conducting emergence counts
2) May occur at cave and mine entrances, bridges

Questions 4-5 (regarding Wildlife Rehabilitation, WR) & Questions 6-7 (regarding Wildlife Control Operators)

WR – typical activities

1) In general, WR have repeated contact with small number of bats
    a. Hand feeding (especially LBB), rehab injuries
    b. Duration of contact: weeks to months
2) Typically dedicate an enclosed room in house, garage, shed
3) Repeated activity within room over weeks-months
4) Those that don't handle bats might nevertheless be in close proximity, feeding bats, recording data for someone who is handling the bats, etc.
5)

Q7: WCO typical activities (3:15 pm conference call).

1) Most activity does not involve handling the bats. Typically, the WCO will do an exterior visual inspection to find where the bats are coming and going from. May involve ascending a ladder and being within 6 feet of the bats (which might be in eaves, or under siding). Typically, the idea is to set up excluders at entrances (one-way devices that allow bats out but not in). Such work is typically not done during the maternity season. Unlike that WCO will be wearing a mask.
2) If bats are in an enclosed space, like an attic, the best management practices do **not** involve entering the space and trying to remove the bats. Instead, educate the client, the use exclusion devices once the maternity season is over. But there are operators (perhaps as many as half) who might be willing to remove such bats if the homeowner insists.
3) If bats are in the living space, WCOs will catch them, usually with a net and gloves. Handling is brief, but might be several minutes while they educate the homeowners (who will often want to see the bat). Place the bat in some container, then release outside. But this will vary by state depending on the rabies guidelines.

Question 8. Again, focus on little brown bats (LBB). We are asking for the most likely range. There is some evidence that the probability of infection is low (based on sequence matching ACE-2 receptor), but other evidence that infection is possible; we don't have infection trials which would be the most useful information. SARS-CoV-2 is a member of a group of viruses that is prone to host switching and recombination. Clarification: the question is asking about the probability of viral replication within the bat tissue, which may or may not lead to shedding virus. (The probability of shedding virus is embedded as part of Question 13).

Questions 9-11: Mitigation

Consider the same scenario as Q1-3 – person is asymptomatic, actively shedding virus. The change here is that now management agencies have provided training and compliance oversight in the use of enhanced PPE. This includes the training and use of N95 respirators, as well as training in the use of PPE already in place under current WNS recommendations. Note that training may or may not change compliance either in the mean compliance or the variance in compliance within each user group.

Subject: Update to the BPERNet Slides

Hi, everyone! We made a couple changes to the slides for tomorrow. Nothing substantive, just our approach to conducting the brief-out discussions and the order of a couple of the initial slides.

A reminder again to please be in the lobby at 0745, the bus will depart for Chulalongkorn promptly at 0800.

V/r,

Katie Leahy

Subject: BPERNet: Transportation Times and Other Useful Information (30 and 31 January 2017)

Hello, everyone! Welcome to Bangkok. On behalf of the Executive Committee (Dr. Martha Stokes and Dr. Mary Lancaster), we are so pleased that you are able to join us this week for our BPERNet planning meeting and other PMAC activities.

Please use this email as your resource for information regarding transportation, logistics, and other coordinating information for 30 January – 31 January.

30 January – BPERNet Meeting at Chulalongkorn Hospital

1. **The bus will depart from the Renaissance Hotel promptly at 0800** ; please be in the lobby for head count at 0745
2. We will provide coffee and light refreshment during the meeting; you will take lunch at one of the many canteen options at the hotel; please bring about 200 - 300 thai baht (~10 USD) for lunch

31 January – PMAC / BPERNet Field Trip

1. **The bus will depart from the Renaissance Hotel promptly at 0630** ; please be in the lobby for head count at 0615; please make sure that you are on time, as we are caravanning with a delegation from the Centara Hotel and will receive a police escort to move us quickly through traffic
2. We will provide a box breakfast for the bus ride
3. Please make sure that you dress appropriately for this field trip; we strongly suggest covered shoes and loose, comfortable clothing; in addition to this mode of dress we also suggest that you bring accompaniments for spending a day outdoors amongst bat roosts; such as:
    a. Hat
    b. Sunscreen
    c. Sunglasses
    d. Bug spray
    e. Water bottle

We will provide information regarding the Ambassador's reception at the close of tomorrow's meeting.

Again, we are so excited to have you all here. Please do not hesitate to reach out to me or Megan Hudson (copied) if you have any questions.

V/r,

Katie Leahy

Subject: Final BPERNet Read-out
Attachment(s): "Bangkok BPERNet ExecSum_Final.pdf"

All,

Please find the final BPERNet read-out for your files. To everyone who provided feedback, we thank you very much for your responses.

A couple housekeeping items:

1. In the next several weeks, we will begin making plans for our next meeting to take place around the One Health Congress in Saskatoon, Canada. The event feedback you provided will help shape this event and that we anticipate building a 2-day program that includes a scenario-based exercise and presentations.

2. One action item from our Bangkok meeting was to begin discussion about a new name for the network; **please participate in this survey monkey poll to find our new name https://www.surveymonkey.com/r/PQXTHCV**. Please note that the group's will assist the group with establishing a web presence for better communications and outreach, so we depend on your feedback to meet these goals. Please let us know through the survey if you do not feel we are using the right words to communicate the group's core mission.

Thank you again for your participation in these polls and feedback on the report. Please let us know if you have any questions or concerns.

Katie Leahy

Bangkok Meeting Final Report

BPERNET

BAT-ASSOCIATED PATHOGEN AND ECOLOGY RESEARCH NETWORK

TABLE OF CONTENTS

MEETING OVERVIEW

EXECUTIVE SUMMARY

The Bat-associated Pathogen and Ecology Research Network (BPERNet) Executive and Steering Committees met as a side meeting to the Prince Mahidol Award Conference (PMAC) on 30 January 2018 at the Chulalongkorn Hospital and University in Bangkok, Thailand. This meeting served as a follow-up to its kick-off meeting in Fort Collins, CO in June 2017, where the group chartered research objectives and terms of agreement. Members of the Executive Committee (EC) and the Steering Committee (SC) chairmen developed an agenda to meet the following objectives: (1) define working group focus areas, resource needs, and outreach plans; (2) build strategy maps to identify, prioritize, and address BPERNet research gaps and needs; and (3) discuss short and long-term processes to collect and collate applications to the network. A complete agenda from the meeting in addition to a list of its participants may be found in Annex A and Annex B, respectively.

Figure 1Members of the Executive and Steering Committee at the BPERNet Meeting in Bangkok on 30 January 2018.

The meeting began with remarks from Professor Sutep Gonlachanvit from Chulalongkorn Hospital and University and Mr. Lance Brooks from the Cooperative Biological Engagement Program and followed with a review of the interim progress towards finalizing the group's research Terms of Reference. The Executive Committee leads, Dr. Martha Stokes (CBEP SEA Science Lead) and Dr. Mary Lancaster (CBEP Africa Science Lead) facilitated a review of the network objectives, outlined progress since its last meeting, and set the guidelines for the meeting. Participants then broke out into the research focus areas that were established in Fort Collins to develop strategic maps for each working group, consisting of objectives, metrics, challenges, and potential investments, projects, and activities.

Ultimately, meeting organizers and facilitators agreed that the meeting achieved its objectives. Working within their focus group areas, and then interactively using the World Café Method, they were able to develop ambitious multi-year strategies and characterize associated challenges and risks to achieving their goals. The group agreed on the importance of its momentum to develop supportive structures for communication and outreach both internally and externally to firmly establish itself as a unique global network of multi-disciplined researchers who aim to answer complex questions at the nexus of One Health.

The meeting's success is evident in the responses from the SC. The SC was given an opportunity to provide feedback via an anonymous survey shortly after the conclusion of meeting. Unanimously the group agreed that the meeting was productive and outlined a path forward for BPERNet. All members noted that their contributions were beneficial and there is consensus about taking steps to moving forward with research and publications. The survey was sent to all participants via email and a summary of the responses can be found in the Participant Feedback section.

BACKGROUND

In 2014, the Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) began leveraging, enhancing, and convening research networks to accelerate its programmatic and research driven targets and end states. CBEP uses this approach as a way to connect its active funded research projects with other projects to help influence effective change for global health security; translating data into policy. Further, by using relationship-based research networks around the globe, made up of interdisciplinary relationships, it will allow for novel and transformative scientific solutions for the world's largest infectious disease threats.

The Bat-associated Pathogen Ecology and Research Network (BPERNet) is a CBEP research network that connects multidisciplinary and One Health expertise to address challenges and threats posed by bat-associated pathogens of security concern. The BPERNet maintains the standards of all research networks that are supported by CBEP, in which members convene as a body of experts and researchers to: (1) share information, data, samples, and protocols; (2) coordinate research activities; (3) build training events and awareness-building workshops at all levels of decision-making authority; (4) develop community standards and best research practices; (5) create mentorship-based opportunities for students, trainees, and early-career researchers to convene, present, and share ideas; (6) establish a community of international research leaders and champions; and (7) reduce outbreak / transmission risk.

Some of the world's most deadly emerging zoonotic diseases are found in bats, including Nipah, Hendra, and Marburg viruses. There are a number of factors which make bats unique disease reservoirs, including their social behavior, distinct physiology and metabolism, ability to travel long distances, nocturnal activity, species diversity, and long life span (10-20 years, compared with a rat's average life of two years).[1] These special bat characteristics, coupled with the impact of human mediated interactions and environmental changes, create research challenges to understanding the bat's role in the global zoonotic disease ecology, which is further complicated by being difficult animals to control within a typical laboratory setting. The BPERNet creates opportunities for policy makers, researchers, conservationists, funders, and students to identify community challenges, develop priority research lists and associated action plans that target needs and gaps, and work at all levels to build awareness of bat-associated disease burden and transmission risks to improve the prevention, detection, diagnosis, and reporting of pathogens of security concern.[2]

MISSION AND VISION

The BPERNet brings together a multidisciplinary and One Health-focused group of scientists, policy makers, research scientists, and medical/veterinary practitioners with interests in bat-related research

[1] Hayman, David T.S., "As the bat flies," *Science* 02 Dec 2016: Vol. 354, Issue 6316, pp. 1099-1100 http://science.sciencemag.org/content/354/6316/1099

[2] Schountz, Tony, "Immunology of Bats and Their Viruses; Challenges and Opportunities," *Viruses,* 2014 Dec; 6(12): 4880-4901. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4276934/

involving pathogens of security concern. The network builds on community standards and best practices for research. The BPERNet identifies and shares information on research funding opportunities offered by multiple institutions. Most importantly, this network fosters international relationships among collaborators, agencies, and organizations, which can produce long-term, sustainable partnerships that withstand changes in government and organization budgets, priorities, postures, and policies.

All members play a role in operationalizing the objectives of the BPERNet, strengthening linkages and reducing overlap in global research on high-priority pathogens of bats (especially zoonosis) to maximize the efficient use of expertise and resources and accelerate the coordinated development of better disease surveillance and control methods.

NETWORK OBJECTIVES

This network will identify and connect interdisciplinary expertise, convening an agile group to adapt to a wide spectrum of arising challenges and threats. By accomplishing the below objectives BPERNet will enable shared learning and research opportunities, establish new research projects, and facilitate joint applications for funding; thus, increasing the opportunity for peer review, especially if a cross-regional and multi-disciplinary team of authors is involved.

- Facilitate interdisciplinary relationships and collaboration to identify research goals and needs for bat-associated disease research and threat reduction; and

- Unify CBEP regions to create a common action plan that yields collaborative and sustainable projects that achieve the following end states:

  (1) better informed policy-makers;

  (2) better informed scientific community regarding funding targets and gaps in areas of research and development;

  (3) better defined threat to global health security from bat-associated pathogens; and

  (4) improved national, regional, and global capacity to detect and respond to pathogens of security concern; and

- Enable better communication, coordination, and outreach at the research and conservation interface.

OUTCOMES FROM RESEARCH FOCUS AREAS BREAKOUT SESSIONS

OPENING COMMENTS

Mr. Lance Books, Division Chief, DTRA CBEP and Professor Sutep Gonlachanvit, Deputy Director of Medicine and Research King Chulalongkorn Memorial Hospital, co-opened the BPERNet meeting by emphasizing the importance of continuing the Research Coordination Network (RCN) for the benefit of the One Health mission. The opening message conveyed the need for continuing infectious disease surveillance and providing opportunities to make new connections through research. Both agreed that the BPERNet ensures the future of interdisciplinary scientific research and provides a venue to address global issues.

MEETING FORMAT AND LESSONS LEARNED

The goals of this BPERNet meeting were:

(1) Define working group focus areas, resource needs, and outreach plans;

(2) Build strategy maps to identify, prioritize, and address BPERNet research gaps and needs; and

(3) Discuss short-term and long-term processes to collect and collate applications to the network

These objectives were set as the "true north" for this meeting, providing a target for participants to think about success from the beginning. General meeting instructions emphasized the importance of working collaboratively, but to also think about general limitations that have inhibited research goals. Emphasis was added that these objectives should be owned by the entire group.

Additionally, the SC worked to finalize the Terms of Reference for Trusted Agents (TORFTA). The SC agreed that the TORFTA will remain a living document and that will be reviewed annually.

Based on participant feedback and observations from event planners, the EC and SC chairs agree that future meetings should be longer, with more interactive portions for strategy building and collaboration exercises. One idea is to develop a scenario (based on a case-study) to engage a multi-disciplinary group through different phases or turns of response. Event organizers felt that presentations from members of the group on their current research interests or funded projects would help others to understand linkages and dependencies in their research. Event organizers have documented all lessons learned and changes will be implemented for future meetings.

AGENDA

The meeting agenda was designed to create two breakout sessions to guide working groups through a single strategy map. The morning session included a large group review of the working group research areas and creation of cross-cutting themes. Working groups then moved into their research areas to develop a mission statement, identify objectives, and highlight needs. The afternoon breakout group session had research areas developing initiatives for steps forward and identifying responsibility for these initiatives. After each session, the world café was used as a method to share the group's findings. Members of each group rotated to the other working groups to hear from a group representative and provide feedback on each topic. The second breakout group was followed by a short presentation of findings and a large group discussion on next steps. The full breakout of the agenda can be found in Annex B.

CROSS-CUTTING THEMES

Prior to breakout sessions, the SC worked to identify cross-cutting themes among all four working group areas. The SC agreed these themes were inclusive of the needs of all working groups and would help the RCN in developing outreach plans and strategy maps.

Cross-cutting themes from the focus area group discussion included:

- Communication, outreach, and advocacy of group goals to decision and policy makers;
- Standardizing common language;
- Optimizing database management and IT networks;
- Analyzing modeling; and
- Workforce development

Additionally, the objectives each working group identified highlight a need to research and publish knowledge gaps and identify the effects of spillover on human and animal health.

WORKING GROUP RESEARCH FOCUS AREA

Prior to breakouts; a whole group discussion outlined and defined the working group research focus areas. Below are the focuses of each group along with the research mentors for each group.

WORKING GROUP 1: HOST/PATHOGEN BIOLOGY AND INTERACTIONS

- Bat Physiology
- Bat Immunology
- Bat Pathology and pathophysiology
- Bat Pathogen Community Ecology (Co-infections and Co-morbidities)
- Distribution of Pathogens Among Species
- Develop Modeling Approaches for Host Dynamics and Epidemiology

WORKING GROUP 1 RESEARCH MENTORS

- Dr. Joram Buza, Nelson Mandela African Institute of Science and Technology, Tanzania
- Dr. Vivek Kapur, Penn State University, U.S.
- Dr. DeeAnn Reeder, Bucknell University, U.S.
- Dr. Gavin Smith, Duke-NUS, Singapore
- Dr. Mary Lancaster, DTRA CBEP, U.S.

WORKING GROUP 2: PATHOGEN SURVEILLANCE, DIAGNOSTIC CAPACITY, AND EPIDEMIOLOGY

- Molecular Epidemiology
- Distribution of Pathogens Geographically and Phylogenetically
- Detection, Diagnosis, and Reporting of Bat-associated Pathogens
- Establish Commonly Used Guidance on Sampling

WORKING GROUP 2 RESEARCH MENTORS

- Dr. Catalino Demetria, Research Institute for Tropical Medicine, Philippines
- Dr. Jon Epstein, EcoHealth Alliance, U.S.
- Dr. Tamar Kutateladze, National Center for Disease Control and Public Health, Georgia
- Dr. Abel Wade, National Veterinary Laboratory, Cameroon
- Dr. Keti Sidamonidze, National Center for Disease Control and Public Health, Georgia

WORKING GROUP 3: ECOLOGY SETTING (BAT, DOMESTICATED ANIMALS, AND WILDLIFE INTERFACE)

- Bat Behavior, Distribution, and Movement
- Domesticated Animals and Wildlife Behavior, Distribution, and Movement impact on Interaction with Bats
- Effect of Anthropogenic Disturbance and Modification on Pathogen Dynamics and Spillover Risk

WORKING GROUP 3 RESEARCH MENTORS

- Dr. Paul Cryan, United States Geological Survey Fort Collins Science Center, U.S.
- Dr. Tigga Kingston, Texas Tech University, U.S.
- Dr. Rebekah Kading, Colorado State University, U.S.
- Dr. Eiichi Hondo, Obihiro University of Agriculture and Veterinary Medicine, Japan
- Dr. Robert Kityo, Makerere University, Kampala, Uganda *

*Was not present at 30 Jan 2018 Meeting

WORKING GROUP 4: HUMAN-BAT INTERACTIONS

- Human Behavioral Risk Characterization
- Hunting and Commodity Chain
- Ecotourism
- Interactions in Human Dwellings

WORKING GROUP 4 RESEARCH MENTORS

- Dr. Kevin Olival, EcoHealth Alliance, U.S.
- Dr. Ian Mendenhall, Duke-NUS, Singapore
- Dr. Supaporn Wacharapluesadee, King Chulalongkorn Memorial Hospital, Thailand
- Dr. Lela Urushadze, National Center for Disease Control and Public Health, Georgia
- Dr. Nesreen Alhmoud, Royal Scientific Society, Jordan
- Dr. Marty Stokes, DTRA CBEP, U.S.

OUTCOMES FROM RESEARCH FOCUS AREA BREAKOUT SESSIONS

BRIEF-OUT FROM WORKING GROUP SESSIONS

Working within their focus group areas, each develop mission statements, multi-year objectives, measurements for success, and identified overall challenges to success. In the table below, mission statements convey the group's long-term overarching goal while multi-year objectives are each outlined with a corresponding measure for success. Finally, the groups identified key challenges to the overall success of their work. The below table reflects a summary of the key findings from the breakout groups and world café. For the original working out-brief please reference Annex C.

Working Group 1 Mission: Explain the intrinsic and extrinsic characteristics that make certain bats susceptible and spread certain diseases and accurately assess the risk of spillover to another animal host.		
Objectives	**Measurements**	**Overall Challenges**
Objective 1: Complete a systematic review of the knowledge gaps on modeling systems. **Objective 2:** Identify modeling systems that are representative of all phylogeographic and phylogenetic areas. **Objective 3:** Evaluate the transmission risk and spillover of pathogens to another animal host.	**Objective 1:** Publish systematic review of modeling systems and knowledge gaps that were defined. **Objective 2:** Model system is defined, characterized, and validated. **Objective 3:** Intrinsic and extrinsic risk factors are identified for major diseases and geographic areas.	• Objectives require a multidisciplinary team. • Consortia would be needed for model systems review and validation.

Working Group 2 Mission: Form regional networks to establish a common methodology for surveillance and sustain the surveillance for both human and animal health. In addition to understanding spillover risk and epidemiology of bat associated pathogens.		
Objectives	**Measurements**	**Overall Challenges**
Objective 1: Create gap analysis of diagnostic tools. **Objective 2:** Create outreach to various groups of researchers and create awareness among the public and science community. **Objective 3:** Establishing a common methodology for surveillance.	**Objective 1:** Publish systematic review understanding the epidemiology of bat pathogens. **Objective 2:** Formation of regional networks. **Objective 3:** Fully understanding the risk of spillover and developing a set of standards for surveillance.	• The logistics and bureaucracy of creating a multidisciplinary team. • Funding to support the efforts to standardize surveillance.

Working Group 3 Mission: Define how and to what extent the ecological context of bats, and human influence on that context, influence pathogen dynamics and spillover threats		
Objectives	**Measurements**	**Overall Challenges**
Objective 1: Engage the ecological community to define system uniqueness and interdependencies. **Objective 2:** Advocate for ecological design and analysis frameworks to pathogen research. **Objective 3:** Build capacity for disease researchers to gather ecological data to provide context for their studies. **Objective 4:** Define emerging ecological principles that could inform spillover threats. **Objective 5:** Establish key messages and conduct efforts to promote a culture of conservation among One Health researchers, practitioners, and stakeholders.	**Objective 1:** Pathogen research community acknowledges and integrates ecological systems and interdependencies. **Objective 2:** BPERNet research projects are designed using the framework for well-balanced outcomes. **Objective 3:** More studies return to ecological data. **Objective 4:** Emerging ecological principles become widely-accepted governing principles for practice. **Objective 5:** BPERNet establishes itself as a consistent and unbiased perspective from the community and its statements are widely accepted and distributed.	• Science communities have polarized and insular view of bats and diseases. • Lack of collaboration and communication efforts.

Working Group 4 Mission: Fully develop, understand, and communicate the bat and human interface to key stakeholders and communities.		
Objectives	**Measurements**	**Overall Challenges**
Objective 1: Develop and test policy interventions for specific human-bat interfaces. **Objective 2:** Communicate findings to key stakeholders. **Objective 3:** Develop global risk maps to assess existing data and validate risk maps. **Objective 4:** Identify high risk groups and develop education platforms to measure knowledge, attitudes, and practices.	**Objective 1:** Policy interventions for human bat interfaces are developed and put into place. **Objective 2:** Effectively communicate and publish findings of studies. **Objective 3:** Publish global risk maps highlighting geographic areas of risk. **Objective 4:** Getting community buy-in and understanding of concepts.	• Truthful responses in behavioral research on bat-human interactions. • Accuracy of risk map and models. • Cultural barriers and beliefs.

ACTION ITEMS

The following Action Items were recorded and compiled by the organizational and administrative support staff of CBEP / Executive Committee for the BPERNet.

ACTION	APPROACH FOR COMPLETION WITH DATES	RESPONSIBLE AGENTS
Develop communication plan	(1) Themes and key messages (2) New name (3) Outreach (4) Social media (5) Recruitment and marketing	(1) Contingent on establishment of 5th working group; looking into Science Communication experts
Develop website plan	(1) Communication and outreach (2) Collaboration (3) Research mapping	(1) Contingent on establishment of 5th working group.
Publication of protocols and assays	(1)	(1)
Working Groups complete mission statements ***Change?*** Conduct System Reviews to Outline Knowledge Gaps	(1) ***	(1) ***Contingent on Working Group Leads
Conduct Series	(1) SEABCRU (2)	(1)
Publication of Perspectives and Policy piece	(1) Concept pitch (2) Outline (3) First Draft (4) Final Draft	(1) Perspectives Paper: Dr. Mary Lancaster, CBEP and Dr. Vivek Kapur, Penn State (2) Policy Forum: Dr. Marty Stokes, CBEP and Dr. Jon Epstein, EcoHealth Alliance
Conduct a 'funders meeting'	(1)	(1) CBEP

Star-Idaz

Economist debate-style forum

PARTICIPANT FEEDBACK

An after-event survey was sent to the SC to collect information on their progress and overall thoughts on the progress of the RCN. Members were asked to answer the following questions:

1. What did you like about the meeting?
2. Do you think the objectives for the 30 January BPERNet meeting were achieved? Please explain your answer.
3. What do you wish we did differently?
4. What does success of this network look like to you, for your field of study?
5. Will you be able to attend the next meeting in Saskatoon Saskatchewan (5th International One Health Congress) 22-25 June?
6. What do you wonder? As an example, "Do you wonder if this effort is worth your time?"
7. Additional comments.

Responses were collected from the majority of the attending SC and reflected a positive outlook on both the progress of the meeting and the future of BPERNet. The SC felt the 30 January meeting was well organized, with a clear agenda that increased the productivity of each working groups. Comments from members pointed to the formally developed themes and roles for each working group as the main reason for the meeting's success. The SC agreed success of BPERNet will be achieved when the gaps identified are addressed, there is a standardization of data collection, and the completion of one or more research projects advancing the understanding of and response to emerging pathogen reservoirs in bats. Overall, the only change the group asked for was to extend the next BPERNet meeting to at least two full days. The majority of members will be present at the 5th International One Health Congress meeting and a longer side BPERNet meeting should be arranged during this time period.

ANNEX A – PARTICIPANTS

The following participants attended or were invited to attend the

STEERING COMMITTEE MEETING INVITEES, DID ATTEND		
Mendenhall	Ian	Duke-NUS, Singapore
Buza	Joram	Nelson Mandela African Institute of Science and Technology, Tanzania
Kapur	Vivek	Penn State University, U.S.
Olival	Kevin	EcoHealth Alliance, U.S.
Epstein	Jonathan	EcoHealth Alliance, U.S.
Kading	Rebekah	Colorado State University, U.S.
Urushadze	Lela	National Center for Disease Control and Public Health (NCDC), Georgia
Kutateladze	Tamar	National Center for Disease Control and Public Health (NCDC), Georgia
Sidamonidze	Keti	National Center for Disease Control and Public Health (NCDC), Georgia
Wacharapluesadee	Supaporn	WHO CC for Research and Training in Viral Zoonoses, King Chulalongkorn Memorial Hospital, Thailand
Wade	Abel	National Veterinary Laboratory of Cameroon (LANAVET)
Demetria	Catalino	RITM, Philippines
Kingston	Tigga	Texas Tech University, U.S.
Cryan	Paul	USGS Fort Collins Science Center, U.S.
Reeder	DeeAnn	Bucknell University, U.S.
Smith	Gavin	Duke-NUS, Singapore
Alhmoud	Nesreen	Royal Scientific Society, Jordan
Hondo	Eiichi	Obihiro University of Agriculture and Veterinary Medicine, Japan
STEERING COMMITTEE MEETING INVITEES, DID NOT ATTEND		
Kityo	Robert	Makerere University, Uganda
CBEP AND CBEP CONTRACTOR INVITEES, DID ATTEND		
Lancaster	Mary	DTRA CBEP
Stokes	Marty	DTRA CBEP
Brooks	Lance	DTRA CBEP
Newman	Carl	DTRA CBEP
Leahy	Katie	GSE
Hudson	Megan	GSE

ANNEX B – MEETING AGENDA

The following agenda was set for the meeting. The majority of discussions focused on administration, organization, and focus of the network. The group did not get to the topics to prioritize research gaps and set action plans with short and long-term milestones and deliverables. Event facilitators organized questions and prompts for those sessions, which they will use for the next BPERNet meeting.

Time	Session	Notes
0830 - 0845	Introduction and Meeting Objectives	Lance Brooks and Sutep Gonlachanvit will welcome all participants and provide a brief overview of the meeting objectives for the week
0845 - 0900	⇒ Review interim accomplishments since 27 June ⇒ Q&A on TORFTA changes ⇒ Call for votes to accept TORFTA	Executive Committee members will provide an overview of the TORFTA and mission areas; all participants will receive final version ahead of meeting
0900 - 1000	Working Group Focus Areas	Review WG focus areas that were outlined during the 27 June meeting ⇒ Review breakout group objectives and end goals ⇒ Review strategy map
1000 - 1015	Tea Break	
1015 - 1115	Breakout Group Session I	Breakout Group Session 1 Objectives: ⇒ Define WG research areas (sub-focus area definitions) ⇒ List and prioritize research questions and potential projects for each area ⇒ Identify internal and external research dependencies for each Working Group
1115 - 1200	Breakout Group Session I Interactive Feedback	Each group will participate in world café and rotate to review each group's findings
1200 – 1330	Working lunch / Open discussion	Open discussion objectives ⇒ Discuss group marketing campaign ⇒ Members should be prepared to introduce other network affiliations, conferences, and meeting opportunities to market the network, globally ⇒ Discuss long-term process to collect and collate applications to the network
1330 – 1430	Breakout Group Session II	Breakout Group Session 2 Objectives: ⇒ List out WG research coverage (who is researching what and where)

		⇒ Identify research gaps and needs ⇒ Identify WG resource and coverage needs (e.g., target environmentalists in Europe); identify critical POCs for membership ⇒ Begin drafting short and long timelines and work plans
1445 – 1530	Breakout Group Session II Interactive feedback and brief-out	Each group participated in the world café and then briefs out their discussions according to the objectives; brief-out 5 minutes / WG
1530-1545	Tea Break	
1545 – 1630	End of session	End of Session Objectives: ⇒ Review Strategy Map ⇒ Review Action Items ⇒ Discuss date, level of participation, and location for next meeting (all participants should come prepared to briefly discuss their ideas for this topic)

ANNEX C – GROUP BRIEF-OUT SLIDES

Each group was provided 10 minutes at the end of the day to present their strategic mapping work; below are the final slides that were presented.

Group 1

5 MINUTES

What must the Working Group achieve?	How will success be measured?
OBJECTIVES	MEASURE
• Almost all (ex. NIH, WT, WHO, France, Germany, India, China, Australia)	Almost all (ex. NIH, WT, WHO, France, Germany, India, China, Australia)

• Systematic review/knowledge gaps on model systems and transmission risk (short-term goal)
• RFP for model systems to answer:
  • Innate and adaptive immune response
  • Mechanisms of susceptibility
  • EnvironmentaL/l host conditions that are necessary for spillover
  • Resistance and susceptibility of certain bats species and certain pathogens
  • Co-infections and their role in pathogen ecology / spillover risk
	• SYSTEMATIC REVIEW / KNOWLEDGE GAPS DEFINED - PUBLISHED
	• RFPS ISSUED - TEAMS ASSEMBLED / ESTABLISHED
	• MODELS DEFINED / CHARACTERIZED / VALIDATED
	• KEY INTRINSIC/EXTRINSIC RISK FACTORS IDENTIFIED FOR MAJOR DISEASES / GEOGRAPHIES

1. Immunologist 2. Genomics 3. Cellular and molecular biologist • Ecologist /Trans Dynamic model • Systems biologist • Risk assessment • Bioinformatics • Microbiologist • Infectious disease	1. RESEARCHERS; FUNDING AGENCIES; POLICY MAKERS; OIE/WHO

Investments, activities, and projects	Responsibility	Needs and risks
INITIATIVES	WHO	CHALLENGES
• BPERN / Multiple other	Almost all (ex. NIH, WT, BBSRC/DfId OTHER COUNTRY FUNDING AGENCIES)	• Multidisciplinary by nature there isn't a single funding source • Consortia would need to be created for model systems

• Model Systems
  • Systematic review
  • RFP
• Natural and experimental disease transmission models
• Tool Kits
	Working Group 2 creates systematic review in which we identify gaps and lay out what would need to be in a RFP	• Quantifying and communicating Risk
		• Lack of baseline knowledge

1. Immunologist 2. Genomics / bioinformatics 3. Cellular and molecular biologist • Ecologist /Disease transmission dynamic modelers • Systems biologists • Risk assessment • Microbiologists / Infectious disease specialists	Researchers; funding agencies; other stakeholders	• Quantifying and communicating Risk • Lack of baseline knowledge • Promoting collaboration

5 MINUTES

Group 3 Mission: define how and to what extent the ecological context of bats, and human influence on that context, influence pathogen dynamics and spillover threats

What must the Working Group achieve?	How will success be measured?
OBJECTIVES	MEASURE
Objective 1: Engage the ecological community (including research groups, individuals, and networks) to define system uniqueness and interdependencies (movement, community, nutritional, physiological, social, reproductive, conservation, and population ecologies etc. **Objective 2:** Bring ecological design and analysis frameworks to pathogen research; advise the community of innovative and supportive technologies **Objective 3:** Build capacity for disease researchers to gather ecological data to provide context for their studies **Objective 4:** Define emerging ecological principles that could inform spillover threats **Objective 5:** Establish key messages and conduct efforts to promote a culture of conservation among One Health researchers, practioners, and stakeholders; BPERNet SC provides timely statements on potentially contentious research	**Objective 1 Measurement:** Pathogen research community acknowledges and integrates ecological system and interdependencies **Objective 2 Measurement:** BPERNet research projects are designed using the frame work for well-balanced outcomes **Objective 3 Measurement**: More studies are returning ecological data **Objective 4 Measurement:** Emerging ecological principles become widely-accepted governing principles for practice **Objective 5 Measurement:** BPERNet establishes itself as a consistent and unbiased perspective from the community and its statements are widely accepted, respected, and distributed

Group 3 Mission: define how and to what extent the ecological context of bats, and human influence on that context, influence pathogen dynamics and spillover threats

Investments, activities, and projects	Responsibility	Challenges, needs, and risks

1. Conduct a literature review of bat-associated papers to assess how many incorporated conservation principles and authorship
2. Conduct DTRA call for sampling opportunities associated with existing ecological research
  1. Demonstrate contribution to ecology of disease emergence
  2. Demonstrate existing funding (not associated with potential funding)
3. Ensure that any future solicitations include language that explicitly incorporates an ecology framework where relevant
4. Collect case studies for messaging
5. As part of a repository of 'tool kits', develop an ecology 'tool kit'; conduct tactical field activities to learn how to use and teach-back the tool kit
6. International Bat Research Conference (IBRC) 2019 – attend and participate (with 5-10 participants for discussion Q&A)
7. Convene a series of 'conservation awareness-building' workshops
8. FOR NEXT BPERNet MEETING: longer planning meeting, develop and work through a scenario that incorporates all the working group for future discussion-based training events
	1. WG
	2. CBEP / BPERNet
	3. CBEP (and other fudners)
	4. WG – 3
	5. WG – 3
	6. BPERNet
	7. WG – 3
	8. BPERNet
		• "The Great Divide" – solution: build awareness
		  • Vocal and polarized bat community
		  • Insular bat and disease communities
		  • Insensitive disease community
		• Lack of collaborative efforts
		• Communication issues

Group 4

5 MINUTES

What must the Working Group achieve?	How will success be measured?
OBJECTIVES	MEASURE
Identify other funding initiatives	Number of visits to website Number of proposals submitted and projects funded
Better understand bat/human interface Develop and test policy interventions for specific human-bat interfaces	Baseline knowledge and gaps identified Database development Maps and models developed Guidelines for human behaviroal risk characterization developed and used Intervention policies developed and tested
Communicate findings to key stakeholders • Policy makers • Community members (high risk groups)	Number of workshops and attendees (conventional metrics) Before and after surveys for KAPs

Investments, activities, and projects	Responsibility	Needs and risks
INITIATIVES	WHO	CHALLENGES
Create and curate web page with potential funding opportunities	BPERN; CBEP (to liaise w other USG funders); country governments	Lack of transparency and coordination among donors and recipients (=duplication) Silo'ing of funding Some countries (e.g. Singapore) doesn't fund outside of country Shaping national/country funding priorities
Develop global risk maps Assess existing data and literature review Research studies/support for ecol, social, and econ drivers Studies of seasonality Identify and model policy interventions Validate/ground-truth risk maps	BPERN, academics, research orgs, NGOs, and countries	Truthful responses in behavioral research Ensuring interventions developed will be acceptable and econ viable. Accuracy of risk maps/models
Identify target audience, and high risk groups Develop education platforms/materials Research to measure changes in knowledge, attitudes, and practices (KAP)	BPERN; SEABCRU; social behavioral scientists (needed); communication and PR specialists	Getting community buy-in and understand concepts Cultural barriers and beliefs (e.g. bats are medicinal to eat) Dissemination of info to larger group

Subject: Final version of North American bat/SARS2 ms - PLEASE REVIEW
Attachment(s): "Table S1 for Olival et al. bat CoVs_V5.xlsx","Olival et al. bat CoVs 20200425_V6.1.docx","References cited Table S1_V5.docx"

Dear Esteemed Colleagues,

Please review the attached penultimate draft of our manuscript (now entitled: **'Possible risks of SARS-CoV-2 spillover to free-ranging wildlife: a case study of bats")**, together with the supplementary table and refs. Our plan is to submit to *Lancet Infectious Diseases* as a review article (correct length and they allow 150 refs) in the next week - references are currently formatted for that journal. We would also like to post it on bioRxiv as a pre-print once we get it submitted to *Lancet ID*. Please let me know if you have any concerns with that plan.

Thank you all for your excellent comments and edits on the previous draft. Paul and I have gone back and forth on several rounds of revisions since then (and multiple late night texts), aiming to take each and every suggestion into account, and we believe it's a much better manuscript now! Very excited about this one, and looking forward to getting it published!

By Thursday April 30th (or ASAP), could you each please:

1. Confirm that you agree to be a co-author.
2. Double check your name and affiliation, and send me your ORCID number if you have one.
3. Read through the ms and send any important, last minute changes or edits you feel are necessary. Please use track changes. If you're okay with the ms as is, please just confirm so.
4. For my Federal US Gov't friends (USFWS, USGS, CDC, USDA) - please let us know what we need to do for approval on your end. I know Paul is working with USGS now to hopefully get rapid clearance.

No need to cc all if you don't want, but please include both me and Paul on your response.

Looking forward to hearing from you all soon!

Cheers,
Kevin and Paul

Spillover of pandemic viruses

The threat of emerging infectious diseases (EIDs) to wildlife health and biodiversity conservation is recognized,[1] but cross-species transmission of novel pathogens, or spillover, is typically viewed in the narrow context of originating *from* a wildlife reservoir and transmitting *to* humans.[2] Research assessing EID risk has typically focused on identifying geographic regions[3,4] and wildlife species[5-7] whereby spillover of zoonotic diseases into humans is most likely. Among recent pandemic zoonotic viruses, some have no evidence of transmission back to wildlife or domestic animal populations after establishment in people (e.g., human immunodeficiency virus, which causes acquired immunodeficiency syndrome), while others have crossed species boundaries with fluidity (e.g., pandemic H1N1 influenza A virus).[8-10] Evidence of 'reverse zoonoses' transmitting from people to wildlife and domestic animals is widespread[10], however systematic surveys to determine the proportion of EIDs that spill back into novel wildlife hosts are lacking. Evidence of humans infecting bats with any virus is limited to a single observation,[11] and onward transmission[12], or viral spread from an initial infected individual to an entire bat population, has not been recorded. Bats rank among the most ecologically important, but underappreciated, mammals that play varied roles in most of Earth's ecosystems; bats are primary nocturnal predators of invertebrates and small vertebrates, as well as pollinators and seed dispersers of many tropical plants.[13,14]

In December 2019, a novel coronavirus was detected from a cluster of 41 atypical pneumonia cases in Wuhan, China, and has since spread to cause a pandemic.[15] As of late April 2020, the virus had reached over 185 countries, infected >2.7 M people, and killed >195,000. Phylogenetic evidence suggests that this virus, now named severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), along with the entire clade of SARS-related coronaviruses (SARSr-CoVs), evolved in Old-World bats of the family Rhinolophidae.[16-18] There is no epidemiological evidence of direct or indirect transmission of SARS-CoV-2 from bats to people, but the closest known virus to SARS-CoV-2, with 96% sequence similarity across the virus' genome, was discovered in an intermediate horseshoe bat (*Rhinolophus affinis*) sampled from Yunnan province, China in 2013.[19] The timing of SARS-CoV-2 spillover from bats to humans, and whether an intermediate host species was involved, remain undetermined.[20,21] The United States (U.S.) currently has the highest number of confirmed human cases of COVID-19, the disease caused by SARS-CoV-2, with transmission reported in all 50 states. The unintended consequences of this pandemic are many and include the possibility of SARS-CoV-2 transmission from humans to free-ranging wildlife populations. Given the likely bat origin of SARS-CoV-2, bats are a group of primary concern for spillover from humans. Anticipating the need for similar risk assessments across many potentially vulnerable species of wildlife and domesticated mammals globally, here we assess the possibility of humans inadvertently infecting free-ranging North American bats with SARS-CoV-2. We further discuss the possible public health and wildlife conservation consequences of SARS-CoV-2 becoming endemic in bats outside its natural host range.

The triple threat of SARS-CoV-2 to North American bats

The pandemic human spread of SARS-CoV-2 may directly or indirectly threaten North American bat populations in at least three different ways. First, SARS-CoV-2 might infect the diverse and historically isolated 40+ endemic species of temperate-zone North American bats, with or without causing disease. Second, SARS-CoV-2 might infect and then become established

in one or more North American species, creating novel wildlife disease reservoirs capable of causing future human infections. Third, if SARS-CoV-2 infection persists in North American bats of one or more species, it could potentially evolve, or recombine with endemic viruses, to become more pathogenic or infectious to humans or other animals. In addition to new public health challenges, the latter outcomes could quickly shift public perception of bats from mostly beneficial wildlife with manageable associated disease risks, to bats posing unacceptable disease risks to human health. Such shifts could increase the likelihood of harmful human-bat interactions, as well as undermine decades of concerted science, conservation, and education efforts aimed at protecting these important animals.[22] The potential threats outlined above apply to many species of wildlife and domesticated mammals, but the likely bat origin of SARS-CoV-2 and the current state of disease-ravaged bat populations in North America influenced us focus this review on bats.

Lessons from an epizootic -- susceptibility of North American bats to an introduced pathogen

SARS-CoV-2 is not be the first pathogen with the potential for inadvertent spread from people to North American bats. The COVID-19 pandemic follows the arrival of a fungal pathogen (*Pseudogymnoascus destructans*) that in 2007 began infecting hibernating bat populations in North America, crossing species barriers, spreading among, and altering the evolutionary trajectory of the continent's bats.[23-25] White-nose syndrome (WNS) -- the disease caused by *P. destructans* remains the first and only documented bat epizootic to cause multi-year, spreading mass mortality,[26] although short-term bat die-offs were linked to Lloviu virus in Europe.[27] WNS has killed millions of North American bats, affected populations of at least 12 species of 3 genera, and has already spread across half of the U.S. and Canada. Effective methods to mitigate WNS spread and impacts remain elusive despite substantial research effort, and targeted mitigation actions have had limited success against the disease impacts of WNS.[28] It took years of concerted international scientific effort to identify the cold-growing fungus, determine that it likely originated somewhere in the temperate zones of Europe or Asia, understand its mechanisms of infection and pathogenicity, and track its rapid spread through an immunologically naïve continental assemblage of hibernating bats that largely lacked robust defenses against it.[29-31] The devastating impact of WNS on a diverse group of North American bats likely resulted from evolutionary isolation of the continent's bat fauna from other parts of the world for millions of years, despite other species of *Pseudogymnoascus* being present. No extant species of bat in the Americas also occurs outside of the Americas,[32,33] and no bats migrate or likely survive natural flights across the Pacific or Atlantic oceans.[34,35] Bats in both Europe and Asia can become infected by *P. destructans*, but do not suffer mass mortality from WNS.[36,37] The bat fauna spanning the higher latitudes of North America (in U.S. and Canada) is composed almost entirely of species belonging to the world's largest bat family -- Vespertilionidae with at least 500 described species. Vespertilionid bats occur all over the world, but likely originated and diversified in North America tens of millions of years ago -- this second-largest family of mammals is the only bat family to increase in diversity northward out of the tropics and consistently reach high latitudes (50ºN).[38,39] The WNS epizootic taught us that a large proportion of these historically isolated bats can be vulnerable to a pathogen introduced from another continent during a single event. Additionally, bats already in a physiologically stressed condition due to WNS or other pressures may have increased susceptibility to viral infection, experience exacerbated disease outcomes, and/or increased viral shedding.[40,41] The COVID-19 pandemic invokes the specter of WNS with respect to potential for pathogen spread

through interconnected, multi-species populations that might be immunologically naïve, and highlighs deficits in our understanding of temperate-zone bat pathogens in North America.

Gaps in understanding global patterns of bat-CoV diversity, evolution, and host range

Bats are among the world's most diverse mammals (approximately 1,400 species), and the global distribution and diversity of CoVs in bats proportionally reflects that of their hosts.[42,43] Available evidence indicates that bats are natural reservoirs of CoVs, some of which have the potential to cause diseases in humans, livestock, and other types of domestic animals and wildlife.[19,42,44-56] Coronaviruses appear to have ancient and ancestral relationships with bats, diversifying globally through a process of within-host evolution and cross-taxonomic host-switching events.[42,56-58] Indeed, bats are the likely mammalian progenitor hosts of all alpha (α-) and beta (β-) CoVs[59] and potentially all coronaviruses.[60-62] Alpha-CoVs of likely bat origin include the causative agent of swine acute diarrheal syndrome (SADS) that caused mass mortality of piglets on farms in Guangdong province, China,[53] and a variant strain of porcine epidemic diarrhea virus (PEDV) that spread rapidly from China in recent decades and caused mass piglet mortality in multiple U.S. states.[63,64] Human CoVs NL63 and 229E also likely had their evolutionary origins in bats.[56,65] Two recent human disease epidemics (severe acute respiratory syndrome [SARS], Middle East respiratory syndrome [MERS]) and now the current COVID-19 pandemic were caused by viruses that probably originated from β-CoVs circulating in bat populations in regions where the outbreak occurred.[19,21,45-50,54,55,66]

Emergence of diseases like SADS, PEDV, SARS, MERS, and now COVID-19 from the same general region strongly indicates a close association between CoVs that are likely to evolve into pathogens and the wildlife reservoirs from which they originate.[19,45-50] The evolutionary relationships of CoVs within bats are consistent with geographically structured transmission cycles, with occasional transmission among related bat species.[42,54,67] These phylogeographic factors are also universal determinates of viral sharing among all mammals.[68] However, bat-virus association patterns can be particularly difficult to discern because bats often roost together in multi-species aggregations that can facilitate viral sharing, with each capable of asymptomatically harboring multiple CoV lineages.[42,54,55,69,70] Host shifts to more divergent, non-bat hosts (i.e., that lead to spillover) are more difficult to predict -- firstly, because the potential host breadth for many CoVs is broad,[51,52,57,71,72] and, secondly, because host susceptibility and onward transmission involve complex, multi-stage processes.[2,12] Bat-CoV associations remain woefully under-sampled and understudied in temperate-zone North America, despite the large number of bat biologists and virologists working in the U.S., Mexico, and Canada.[42,69,73,74]

Are viruses like SARS-CoV-2 already present in North American bats?

Our examination of CoV evolutionary lineages and global distribution patterns of the diverse bats they infect suggests that temperate-zone North American bats could be immunologically naïve to infection by viruses like SARS-CoV-2. Alpha and β-CoVs have been detected in bats on most continents, sometimes with both types occurring in bats of the same species.[54,55,75] However, an exception to this pattern is the apparent lack of evidence that β-CoVs infect bats of temperate-zone North America, despite methods suitable to detect both α- and β-CoVs.[56,69,74,76] Multiple novel α-CoVs have been detected and described in vespertilionid bats of the U.S. and Canada, infecting species both living in close contact with humans and in remote wild areas.[56,69,74,76,77] However, SARSr-CoVs and β-CoVs of the viral subgenus *Sarbecovirus* have

thus far been detected almost exclusively in species of the Old-World Chiropteran suborder Yinpterochiroptera (figure 1A, table S1).[42,54,67] The few exceptions to this pattern were detection of novel Clade 3 and Clade 1 *Sarbecovirus* (*sensu*[48]) in the wrinkle-lipped bat (*Mops plicatus*, family Molossidae) in China[78] and the vespertilionid lesser noctule (*Nyctalus leisleri*) cohabiting a Bulgarian cave during autumn with several species of rhinolophids in which other SARSr β-CoVs were concurrently detected, suggesting cross-species infections (figure 1A).[79] Putative detections of a Clade 1 *Sarbecovirus* were also reported from guano samples of the vespertilionid brown long-eared bat (*Plecotus auritus*) and the molossid European free-tailed bat (*Tadarida teniotis*) on Sardinia, where the same novel β-CoV was described from greater horseshoe bats (*R. ferrumequinum*).[80]

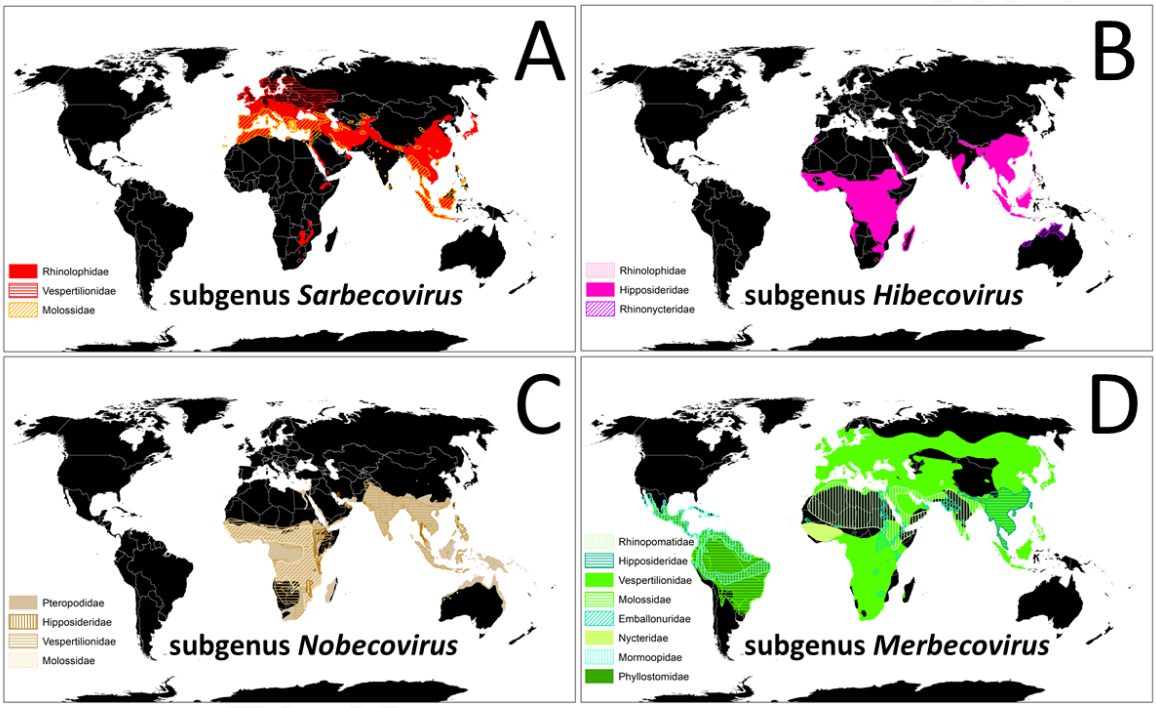

Figure 1. Global patterns of bats and associated beta-coronaviruses (β-CoVs). A) red-shaded distributions of bat species in which SARS-related β-CoVs of the subgenus *Sarbecovirus* have been detected; B) pink-shaded distributions of bat species known to host β-CoVs of the subgenus *Hibecovirus*; C) brown-shaded distributions of bats in which β-CoVs of the *Nobecovirus* lineage have been detected; and D) green-shaded distributions of bats known to host MERS-related β-CoVs of the subgenus *Merbecovirus*. Different colors and shade styles within each panel represent different families of bats. See table S1 for species lists and data sources. Maps created using ArcMap (ESRI, Redlands, California, USA) and bat ranges derived from spatial data on terrestrial mammals from the International Union for the Conservation of Nature (IUCN 2020. The IUCN Red List of Threatened Species. January 2019 [version 6.2]. https://www.iucnredlist.org; Downloaded on 11 April 2020).

Viruses in the β-CoVs subgenera *Hibecovirus* and *Nobecovirus*, also tend to associate mostly with Old-World bat families, except for novel viruses of the latter subgenus detected in four species of the vespertilionid genus *Scotophilus* in Asia and Africa (figure 1B, C; table S1).[42,54,67]

Bat β-CoVs of the subgenus *Merbecovirus* (MERS-related lineage) occur in a greater diversity of bat families and across more global regions than the other subgenera (figure 1D).[42,54,67] These widely distributed MERS-like viruses can cause disease in humans (e.g., MERS) and notably appear to be the only bat β-CoVs to diversify among several families of the globally distributed suborder Yangochiroptera (figure 1D, table S1).[42,54,67]

Lack of evidence for β-CoVs in temperate-zone North American bats

The several hundred species of extant bats spanning the Americas all belong to the suborder Yangochiroptera, which likely diverged from the Old-World suborder Yinpterochiroptera more than 50 million years ago (figure 2).[81] The only β-CoVs detected in the Americas to date belong to the subgenus *Merbecovirus*, and appear restricted to two exclusively Neotropical bat families (Phyllostomidae and Mormoopidae) and one that is globally distributed (Molossidae). Distinct CoV lineages in the subgenus *Merbecovirus* were described from three species of *Pteronotus* (family Mormoopidae) and four species of *Artibeus* and Seba's short-tailed bat (*Carollia perspicillata*; family Phyllostomidae) from tropical regions of Mexico (table S1).[42,82,83] Another novel β-CoV of the subgenus *Merbecovirus* was detected in broad-eared bats (*Nyctinomops laticaudatus*, family Molossidae) in southern Mexico.[82] It was subsequently shown *in vitro* that primary kidney cells from the Neotropical bat *Artibeus jamaicensis* could become infected with MERS-CoV, and experimental infection trials demonstrated virus replication and shedding in individual bats of this species but without obvious clinical signs of disease.[84] Available evidence suggests β-CoVs may have arrived to the New World through South America and have long been evolving in Neotropical bats. Although some bat hosts of *Merbecoviruses* overlap geographically with species of temperate-zone North American bats, none occur outside of the Neotropics. Sampling has been limited, but we are not aware of any published detections of *Merbecoviruses* or any other β-CoVs in temperate-zone North American vespertilionid bats.

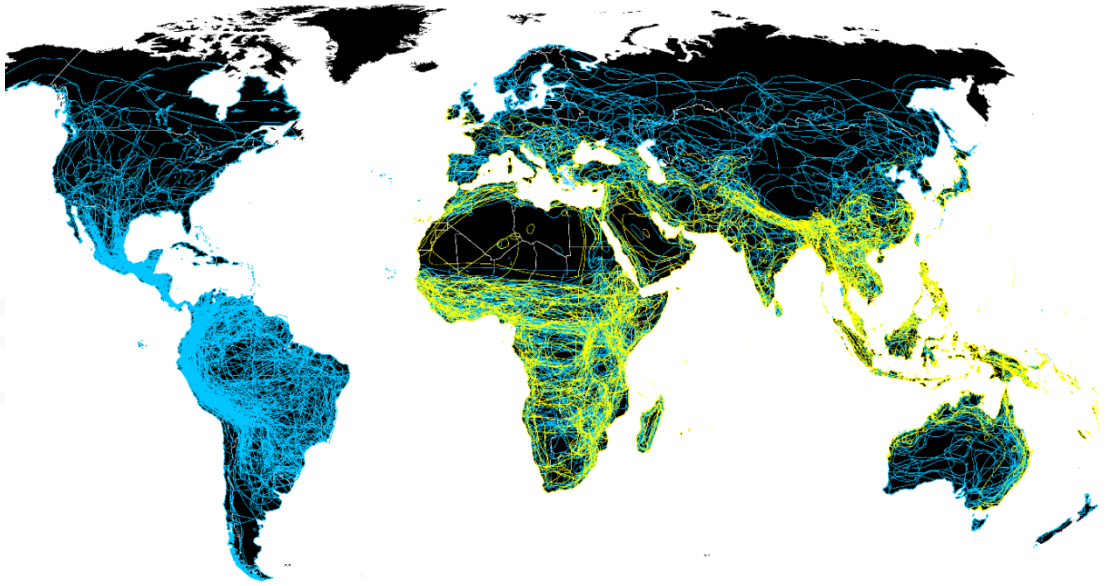

Figure 2. Old-World and New-World bats. Overlapping species distribution outlines of bats in the globally distributed suborder Yangochiroptera (blue) and Old-World Yinpterochiroptera (yellow). Maps

created using ArcMap (ESRI, Redlands, California, USA) and bat ranges derived from spatial data on terrestrial mammals from the IUCN (International Union for the Conservation of Nature (IUCN 2020. The IUCN Red List of Threatened Species. January 2019 [version 6.2]. https://www.iucnredlist.org; Downloaded on 11 April 2020).

Globally, only a fraction of the approximately 1,400 species of bats have been robustly sampled and tested for CoVs. This sampling deficit limits our inference of North American bat host susceptibility to SARS-CoV-2 through examination of known patterns of bat-CoV occurrence and distribution. To our knowledge, the only SARSr-CoVs (*Sarbecovirus* spp)[48,85] documented in the ultra-diverse and globally distributed bat family Vespertilionidae were from Bulgaria[79] and Sardinia,[80] likely transmissions from co-occurring *Rhinolophus* sp. bats. This absence of evidence for β-CoVs in vespertilionid bats in general, and in temperate-zone vespertilionid bats of North America in particular, may represent a sampling deficit or, more likely, a unique biogeographic pattern driven by underlying factors of host susceptibility or life history.

More than half of bats in the U.S. and Canada hibernate,[86] which might have an influence on their susceptibility to viruses, as was postulated for common vespertilionids infected with α-CoVs and rabies virus.[40,87-89] Body temperatures of hibernating bats can remain consistently below 10ºC for periods lasting 7-9 months per year,[90] providing a potential mechanism to limit viral replication and spread. Experimental studies to assess the ability of SARS-CoV-2 or other β-CoV to survive and replicate in bats (cell lines and individuals) at low temperatures would provide additional insight into risk of reverse zoonosis. However, we may currently lack appropriate tools for studying such possibilities, such as immortalized cell lines from several hibernating, vespertilionid bats.[56] Scientists did not discover and isolate the fungus that causes WNS until they prepared samples in bat hibernation sites and moved culture dishes from laboratory benches into refrigerators.[23] Similar innovative explorations outside the typical temperature conditions of laboratory experimentation could help assess risk of SARS-CoV-2 infecting the more than two dozen species of bats in the U.S. and Canada that hibernate to survive harsh temperate-zone winters.

Proactively connecting the wellbeing of human and bat populations

Scientists have long recognized the risk of disease spillover from humans to bats,[91-93] but bat researchers in North America did not systematically address such risk prior to WNS. Outside of reservoir host studies, few bat researchers studied infectious diseases in bats before WNS emerged in 2007,[73] and proportionally few disease researchers studied bat pathogens before bats were retrospectively connected to the SARS epidemic.[17,66,94] An often unstated duality that can inhibit bat disease research is the potential conflict created from the fact that bats are unequivocally ecologically important,[13,14] yet also a source of diverse emerging infectious diseases.[7,94,95] Possible explanations for why bats might host particularly pathogenic viruses include characteristics of their life history (e.g., long-lived, wide ranging, multi-species aggregations, daily and seasonal heterothermy),[94] unique physiology for repairing their damaged DNA,[96] unique ability to regulate immune responses,[97-102] high species diversity,[43] and unmatched metabolic range and high body temperatures during flight.[103] Bats also cryptically come into close contact with humans, increasingly in urban and per-urban settings as a result of native habitat loss, often crossing human-wildlife interfaces.[104-110]

Except for *Lyssavirus* infections, bats rarely show signs of sickness from the same dangerous pathogens that cause virulent disease in humans. Bats cope with viral infections in ways that we do not yet fully comprehend but learning how they do so may reveal important insights to develop therapeutics and ultimately to protect human health.[100-102] *In vitro* and laboratory studies demonstrate that bats can specifically regulate immune response to effectively cope with pathogenic viruses.[111] For example, dendritic cells generated from the bone marrow of the Egyptian rousette bat (*Rousettus aegyptiacus*) infected with Marburg virus downregulate immune-stimulatory pathways and maturation of cells targeted by the virus, while upregulating pathogen-sensing pathways.[112] Unique bat immune regulation may occur with MERS-CoV and SARS-CoV-2 infection, at least under experimental conditions.[98,113] Lack of clear signs of illness in bats and the cryptic habits of many species also generally inhibit our ability to easily detect spillover of pathogens from human to bat populations, further adding to uncertainty about cross-species transmission and dispersal of CoVs among human and animal communities. Laboratory findings suggest human viruses that likely originated in bats, such as HCoV-NL63, seem capable of infecting bat cells, at least *in vitro*.[56] Despite having specialized RNA proofreading machinery, the replicating RNA genomes of SARS-CoV-2 and other CoVs rank among the largest known,[114,115] making them prone to recombination and copy errors in bats with resulting functional adaptations (e.g., altered receptor binding capacity or temperature adaptation of enzymes).[116] CoVs can even recombine with functional fragments of other virus families, such as when a bat-derived CoV gained a functional gene from a reovirus.[117] Spillover of SARS-CoV-2 into North American bats could lead to the virus becoming either less or more pathogenic to bats, domestic animals, or humans through genetic mixing in a new reservoir host. The public-health and conservation consequences of a more virulent virus could be severe, whereas genetic mixing in a bat host that resulted in a less virulent virus might go unnoticed.

Need for an interdisciplinary response

Effectively managing risks of human disease caused by emerging zoonotic pathogens *and* ensuring the health and conservation of wildlife species that are potential reservoirs of those disease agents can be synergistic goals under a One Health framework. Research has shown that spillover risk (from or to wildlife) may be highest in disturbed ecosystems where there is an elevated frequency of human-wildlife interactions or disruption of ecological patterns.[3,118-122] Thus, effective bat conservation and management requires understanding both pathogens that cause disease in bats, as well as human activities and ecological contexts that increase direct and indirect interactions with bats that could present health risks.[2] Furthermore, fear-based reactions to disease risk from wildlife, such as culling infected bat populations or indiscriminate killing, often have negative unintended consequences for the interconnected health of both humans and bats (e.g., culling of bats in a Uganda mine led to a more than doubling of Marburg virus prevalence in the bats living there).[26,123-125] Temperate-zone vespertilionid bats inhabiting human dwellings in the U.S. and Canada represent a particularly relevant human-wildlife interface where conservation and management actions to proactively address the potential consequences for disease spillover may be particularly worth careful consideration.[73]

Conservation-minded surveillance of bat viruses has demonstrated the potential for mutual beneficial collaboration between public health scientists and conservation stakeholders.[91,110,123,126,127] Disease-focused studies that integrate ecological principles into a

rigorous study design provide the most ecologically relevant context to the bat pathogen findings.[128,129] Assessing the risks of SARS-CoV-2 spillback into North American bats presents a timely opportunity to form multidisciplinary scientific teams that include experts on emerging infectious diseases and bat ecologists with expertise on North American bat species.[126] Scientists researching emerging infectious diseases can benefit from methods bat researchers have developed for observing, counting, and non-invasively sampling bats.[73,130] Bat researchers can learn important biosafety, health monitoring, laboratory techniques, safe and secure handling/storage of CoV-positive samples, and training in the proper use of personal protective equipment (PPE) from researchers with expertise in veterinary and medical sciences.[110,129,131] All investigators can work together to develop mutually beneficial goals, such as joint risk communications to the public with effective and balanced messaging about bat populations, especially regarding higher risk areas or activities of human and bat contacts.

The emergence of WNS in 2007 prompted changes to guidance for PPE use and disinfection practices for bat researchers and recreational cavers. Similarly, the emergence of SARS-CoV-2 and other recently emerged viruses will continue to alter the *status quo* of bat research, emphasizing the need to carefully weigh risks and benefits of wildlife research in the context of population-altering diseases.[132] For example, PPE including respiratory protection is a standard practice adopted by the bat virus research community but by few others studying and regularly handling bats [REFS]. Adopting a precautionary approach in the face of widespread COVID-19 transmission, U.S. and international wildlife organizations have advised limiting capturing and handling of bats in the field to minimize the risk of humans infecting wild bats with SARS-CoV-2 until further assessment can be made.[133,134] The urgent research priority of a rapid, quantitative risk assessment and analysis of various mitigation options is currently underway.[133] One key question is whether the proper use of optimal PPE, along with effective risk communication and adherence to other basic biosafety practices[131,135] during field work can significantly reduce the risk of transmission of SARS-CoV-2 from humans to bats. In the interim, until new guidelines are established for handling and near-proximity work with bats, important scientific inquiry can still be considered. For example, temporarily shifting to 'hands-off' bat research methods especially in temperate regions where *Sarbecoviruses* have not been found in bats seems prudent, wherever possible, and could facilitate ongoing work with reduced risk.

Examples of 'hands-off' research strategies

Multiple hands-off research strategies already exist for addressing critical gaps in understanding about CoV diversity, distribution, evolution, and potential health effects in temperate-zone bats. For example, a combination of host-cell receptor analyses and *in vitro* and *in vivo* experimental infections across a diversity of bat and other mammalian species have helped inform potential host range expansion for SARS-CoV-2. The receptors that many CoVs use to gain access to host cells, such as angiotensin-converting enzyme 2 (ACE2) and dipeptidyl peptidase-4 (DPP4/CD26), have undergone positive selection in bats, resulting in diverse and recombinant CoV strains that can likely bind to numerous variants of a host receptor protein and facilitate spillover into other animal species.[42,72] SARS-CoV-2 targets and strongly binds to mammalian ACE2 cell receptors.[72,136,137] Beta-CoVs of the subgenus *Merbecovirus* like those known to occur in the Americas are not known to target ACE2 cell receptors, instead using as a receptor DPP4/CD26 or possibly other receptors.[48,138] Current *in silico* predictions that bats will likely have low susceptibility to SARS-CoV-2 based on ACE2 structural analyses conflict with *in vitro*

evidence and do not take into account ACE2 amino acid sequence variation (including intraspecific variation) that occurs within bats.[19,72,136] Assessing SARS-CoV-2 host range will require additional virus-host receptor binding assays *in silico* and *in vitro*,[19,48,72,136,138] together with future experimental infection studies for confirmation of Koch's postulates. Together these investigations will help quantify the potential for North American bat infection and transmission among free-ranging populations.

Examples of hands-off methods applicable to both bat disease and conservation research include: virus discovery and characterization focused on existing specimens archived in scientific museums;[139,140] monitoring echolocation calls to determine the occurrence, distributions, and seasonal or nightly activity patterns of bats;[141,142] digital imaging methods for counting bats and studying physiology and behaviors in the context of disease;[105,143,144] and sampling guano from below bat roosts to determine bat species and individual identity, population dynamics, and daily or seasonal patterns of bat occupancy and pathogen shedding.[69,145-148] Promising areas for innovation include making technologies for bat research more accessible to a broader global user base, less expensive, easier to use, and scientifically reproducible through open-source hardware, software, and laboratory methods.[149-151] In addition to research, standardized field protocols and probabilistic sampling strategies are needed for monitoring bats and their viruses at continental scales (www.nabatmonitoring.org),[152,153] as are longitudinal studies across multiple sites to better understand the ecological drivers of CoV dynamics and spillover. Developing simple management tools and methods for rapidly assessing risks of virus spillover from humans to wildlife while maintaining scientific rigor could also help with future disease response. It might also be useful to prepare a suite of tools, protocols, and risk communication strategies for natural resource managers and public health officials to immediately deploy while risks are being assessed. Such prepared management resources could range from implementing precautionary approaches and public outreach about enhanced use of PPE for those in closest contact with potentially susceptible wildlife.

Conclusion

The current COVID-19 pandemic highlights the dramatic public health, economic, and societal consequences of virus spillover from a wildlife reservoir, and presents a new set of challenges when considering viral spill back from people to naïve animal populations. While CoVs and bats around the world are evolutionarily entwined, temperate-zone North American bats appear to be evolutionarily isolated from bat β-CoVs -- the group of viruses which have led to serious zoonotic disease outbreaks. Many questions remain about the risk of SARS-CoV-2 to naïve wildlife populations, the influences of human behavior on those risks, and the potential for forming new CoV reservoirs. Cross-species virus transmission events are relatively rare, requiring an infectious reservoir host to be in contact with a recipient host when conditions concurrently favor susceptibility and onward transmission.[12,110,111] The currently unknown but potentially high-consequence risk of SARS-CoV-2 transmission and establishment in North American bats (or other free-ranging mammals) warrants precaution. Strategically managing interactions between people and potentially susceptible recipient species can decrease the probability of cross-species virus spillover.[110] Humans that frequently handle and come into close contact with North American temperate-zone bats, such as bat researchers, rehabilitators, wildlife/pest control workers, and disease investigators, can help decrease any chances of spillover by carefully evaluating how their actions could put entire populations of bats at risk.

We are at a critical nexus of biosecurity and natural resource conservation that will require ingenuity and diligence to continue important research on bats whilst simultaneously evaluating the ecological future of SARS-CoV-2. Our actions during this current pandemic could profoundly influence and protect the health of both humans and bats.

Since the topic of PPE and using masks to limit source-based SARS2 spread was a central theme or the expert elicitation, I thought you might find this zoom talk relevant and hopefully informative. I didn't want to send it to the whole group since I just learned of the talk myself and I'm not really involved with this study, although other members of our branch are (Brian Harcourt, CC'd). Anyway, if you're interested, feel free to join.
Jon

Hi all. One of our DeMaND study collaborators from Stanford, Yi Ciu, is giving a talk today for CDC. He has some interesting data about materials that can be used in community masks. Some of them out perform surgical masks. If he shows the EM/3D x-ray data of NaCl particles penetrating meltbond nonwoven material used in N95 masks, those images alone are worth the price of admission. Feel free to share with your teams, of course.

Thanks,
Brian

Attachment(s): "WHSG and OIE COVID-19 Guidelines 20 Aug 2020.pdf","ATT00001.htm"

Dear all,

Thanks you for your input on the attached guidelines for wildlife researchers in the time of COVID-19. **And, special thanks to** Mindy Rostal, Tiggy Grillo and Marcy Uhart for taking the lead on drafting and integrating all of the valuable comments and suggestions.

This originated from requests for guidance to assist with field research decision making and permitting, but hopefully will be also be a useful more broadly for risk reduction and encouraging professionalism and best practices.

We arranged for this to be a joint guidance document from both the OIE and the IUCN SSC WHSG with the hopes of reaching wider audience.

Please feel free to share either the document attached below or this link: http://www.iucn-whsg.org/COVID-19GuidelinesForWildlifeResearchers

Thanks again for your help with the graphic!

All the Best,

Billy

Guidelines for Working with Free-Ranging Wild Mammals in the Era of the COVID-19 Pandemic

SUMMARY

The SARS-CoV-2 virus, the cause of COVID-19, emerged as a human pathogen in 2019. While it is thought to have a zoonotic source, the original wildlife reservoir and any potential intermediate hosts have not yet been identified. Phylogenetic analyses suggest the progenitor virus is related to beta-coronaviruses previously identified in bats. At this time, SARS-CoV-2 should be considered a human pathogen with people acting as reservoir and sustaining transmission. There is a possibility that SARS-CoV-2 will become endemic in the human population and thus, presents a risk of a potential reverse zoonosis to wildlife as with infectious diseases such as tuberculosis and influenza.

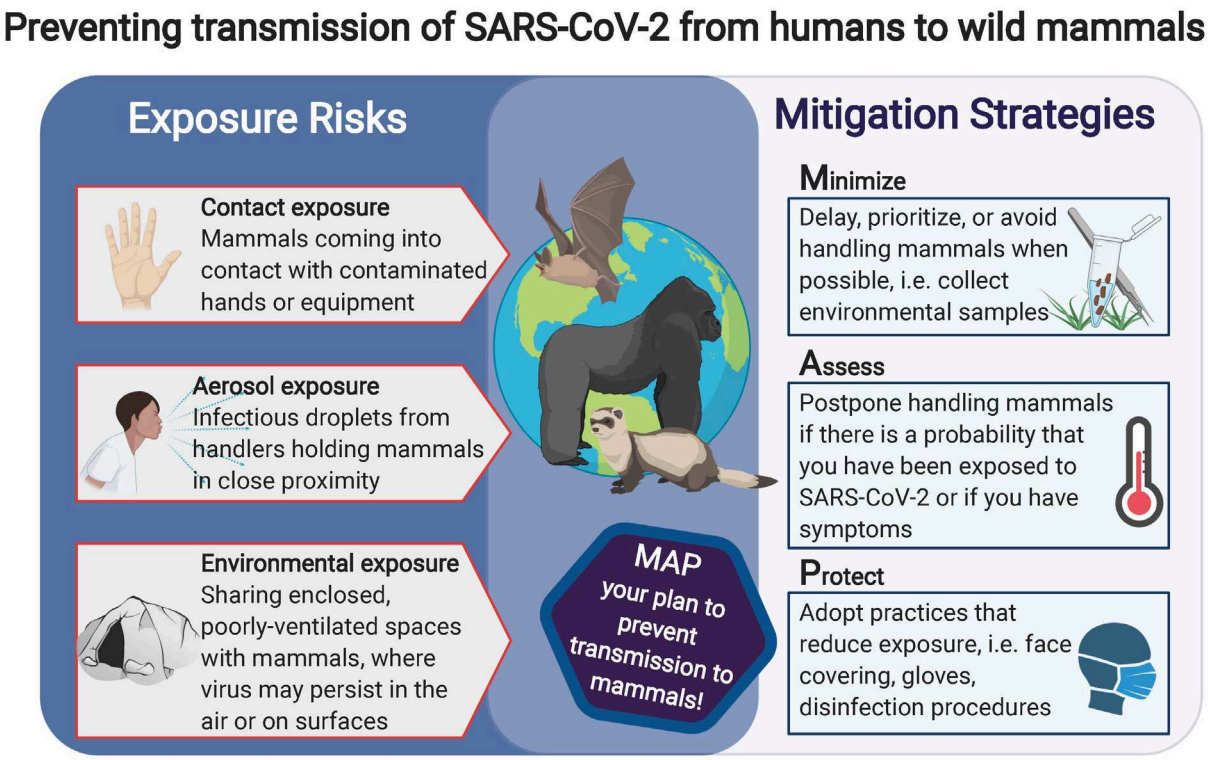
Currently the risk of human-to-animal transmission to non-captive wildlife species warrants concern. A number of cases have demonstrated natural human-to-animal transmission of SARS-CoV-2 in felids, canids and mustelids, the majority due to close and prolonged contact with infected households or people, and none has involved free-ranging wildlife. The identification of close phylogenetically-related viruses (e.g. in bats and pangolins), the presence of important cell receptor proteins (ACE2 receptors) and infection following natural exposure or experimental inoculation suggest that a wide range of mammalian species may be susceptible to SARS-CoV-2. Knowledge and experience with human-to-animal transmission with other human respiratory pathogens (e.g. metapneumovirus, measles, other human coronaviruses and tuberculosis) indicate that some species taxonomically closely related to humans (e.g. non-human primates) would likely be susceptible to infection and/or clinical disease caused by SARS-CoV-2.

There are valid concerns about the health of individuals or populations if infected with the virus and/or a wildlife population becoming a reservoir for SARS-CoV-2. Any wildlife species/taxa that becomes a reservoir for SARS-CoV-2 could pose a continued public health risk of zoonosis, a risk for the transmission of SARS-CoV-2 to other animal species, and risk negative perceptions resulting in human threats to that species or their populations.

Efforts that require working with free-living wildlife are vital to professional management and conservation as well as the health of wildlife, people and ecosystems. The recommendations below were developed to minimize the risk of SARS-CoV-2 transmission from people to free-ranging, wild mammals. Specifically, these recommendations are for people engaged in **wildlife work**[*] in the field, either in direct contact (e.g. handling) or indirect contact (e.g. within 2 meters

[*] These recommendations are provided for trained biologists, conservationists, researchers, veterinarians, etc who work with free-living wildlife in situ. They are not intended for people who interact with wild mammals under different circumstances, such as rehabilitators or ecotourists, etc.

or in a confined space) with free-ranging wild mammals, or working in situations in which free-ranging wild mammals may come in contact with surfaces or materials contaminated by infected personnel.



This figure was adapted in collaboration with the IUCN Bat Specialist group.

RECOMMENDATIONS

These recommendations are based on first principles of biosecurity and hygiene, current knowledge of human-to-animal SARS-CoV-2 transmission and the precautionary principle.

Minimize

In line with ethical considerations for working with wildlife, we recommend that the three "R's" be considered. If postponement is not possible, it is recommended to **"Replace"** work that involves animals with alternatives that do not require handling free-living wildlife (i.e. environmental sampling, remote monitoring); **"Reduce"** the number of animals required to conduct the work and **"Refine**" the methods used to minimize the impact of the handling on the individual animal and on that animal's population. The recommendations given below are focused on "Refine" however, "Replacing" and "Reducing" work with animals should also be considered at all times.

The primary aim of "Refining" work to be done with wild mammals is to reduce transmission of SARS-CoV-2 from a person to wild mammals. Like tuberculosis and measles, SARS-CoV2 may pose a serious threat of transmission from people to wild mammals. Thus, these additional refinements are recommended for those working indirectly with wild mammals within an enclosed space as well as those working directly with/handling free-living wild mammals.

Assess

The SARS-CoV-2 virus will likely be endemic in many human populations for the foreseeable future, making the potential for transmission of SARS-CoV-2 to wild mammals from people an on-going risk. It is recognised that as the local rate of transmission of SARS-CoV-2 in human populations in different localities fluctuates, the subsequent risk of transmission to wildlife will also vary, requiring continuous and adaptive risk assessment. As the level of community transmission (as defined by WHO) increases and decreases according to implemented control measures, so too will the level of risk. When community transmission rate increases, the potential that at least one person on the field team will be infected (even if they do not have symptoms) also increases. This is important as currently almost half of human infections are asymptomatic, which increases the risk of unknowingly transmitting the virus to wild mammals. These factors make it impossible to estimate the exact quantitative risk of human-to-animal SARS-CoV-2 transmission that working with wildlife represents. Thus, when assessing whether to proceed or postpone work it is recommended that one:

1) Postpone the work, unless it is urgent for the health and wellbeing of the animal, if there is known or suspected COVID-19 community transmission, as defined by the WHO, in the area around the site of the wild mammal work or in an area where the team members have been in the past two weeks. Wildlife work should be postponed at least until the transmission rate of COVID-19 has been limited to clusters of cases instead of community transmission (WHO).

2) Confirm that local authorities currently permit this type of work and always follow local public health guidelines regarding COVID-19 prevention; if the work is permitted,

3) Use one's best judgement as to when to work with wild mammals, erring on the side of the precautionary principle (i.e. uncertainty must be resolved in favor of prevention); if one decides to continue,

4) Assess the field team or individual:

    - If someone on the team tests positive for SARS-CoV-2 or has COVID-19 symptoms (WHO), they should follow public health advice on quarantining and avoid working with wild mammals for 2 weeks (WHO) after symptom onset and if symptoms persist, for at least three days after symptoms have resolved without the use of fever-reducing medications. In the case of an asymptomatic infection, avoid working with wild mammals for 2 weeks after the last positive test date.

    - If someone on the team has had contact with a confirmed or suspected person in the past 2 weeks, they should follow public health advice on quarantining and should not work with wildlife for 2 weeks since the potential/known exposure or until they are cleared by public health authorities.

        - This may mean the whole team needs to be quarantined if they were in contact with the team member that tested positive.

    - No one who is currently showing symptoms of SARS-CoV-2 (fever of 38°C [100.4 °F] or greater, cough etc.) should work with wild mammals.

        - Implement daily temperature checks on the days you will be in contact with wild mammals.

        - It is important to avoid taking fever-modifying medicine prior to the temperature check to prevent masking a fever.

    - If possible, each person on the field team should be tested for SARS-CoV-2 with negative confirmation at least 24-48 hours prior to fieldwork commencing, understanding that this may not be feasible in all circumstances/locations.

Protect

If, upon assessment of the local situation, it is determined that work with free-ranging wild mammals may proceed, it remains the team's duty to minimize the risk of asymptomatic transmission of SARS-CoV-2 to the wild mammals (and each other) by using the proper protective equipment and biosecurity measures. To do this, it is recommended that one:

- Follow local public health recommendations.
- Limit the number of personnel to the minimum necessary to safely complete the task and minimize the number of personnel who actually handle or come into close contact (within 2 meters [6 feet]) with wild mammals.
    - Maintain the same field team for the duration of the operation to minimize the number of different people contacting one another and animals.
    - To the extent possible, maintain physical distancing between personnel, particularly during transportation and activities in closed spaces.
- Minimize the amount of time people are in close or direct contact with wild mammals.
- Ensure the people on the team that will have direct contact with wild mammals have been properly trained in using personal protective equipment, infection control and animal handling.
- Wear clean, dedicated clothing (e.g. disposable (Tyvek coveralls) or clothing that will be removed and properly cleaned immediately after sampling, at the site).
- If working **indirectly** (e.g. >2m or in a confined space) with wild mammal species that are considered to be particularly susceptible[†] (e.g. bats, felids, mustelids, non-human primates and any species with the same ACE2 receptor):
    - Wear a face mask or covering, preferably a surgical mask or a more protective covering (e.g. fit-tested N95 without an air release valve).
        - Note a mask or other cloth face-covering is used to prevent the spread of respiratory droplets from your nose and mouth. If surgical masks or respirators are not available locally, it is recommended to use a fitted face covering to improve the ability of the mask to catch respiratory droplets.

[†] Note: as new information becomes available any other taxa / species in which SARS-CoV-2 transmission is demonstrated via natural or experimental inoculation should also be considered "potentially susceptible".

        - If working with a team, team members should wear face coverings regardless of the susceptibility of the animal species as recommended by local public health officials.

- If **directly** handling wild mammals:

    - Wear a face mask or covering, preferably a surgical mask or a more protective covering (e.g. fit-tested N95 without an air release valve) when handling/transporting wild mammals.

        - When handling potentially susceptible species[‡] (e.g. bats, felids, mustelids, non-human primates and any species with the same ACE2 receptor) wear an N95 respirator (**without an air release valve)** or other equivalent/increased respiratory protection (e.g. Powered Air Purifying Respirators).

    - Wash your hands with soap and water and/or apply hand sanitizer (>60% alcohol applied to clean hands) before and after handling wild mammals.

    - Wear disposable or clean reusable gloves, and change gloves between sampling events or handling individuals of solitary species.

    - Do not blow on mammals to see anatomical features or ectoparasites.

    - Keep captured animals separate from each other to greatest extent possible when capturing and handling.

    - Avoid touching your face or mask, and if contact occurs, change/disinfect your hands/gloves.

    - Clean and disinfect all reusable field gear and equipment that may come into contact with wild mammals prior to starting the work and after each field-work shift or between handling individuals of solitary species.

        - When selecting a disinfectant consider its efficacy against SARS-CoV-2 (EPA), its effectiveness against other pathogens (The Center for Food Security and Public Health) that the animal being sampled may carry, and its potential effect on the equipment that will be used and its environmental impact.

            - 70% isopropyl alcohol or a 10% solution of household bleach are recommended for disinfection against COVID-19 (WHO).

            - For both disinfectants, the surface must be cleaned before they are applied, and your working solution of bleach must be made fresh every day.

    - Properly dispose of used materials and biological and hazardous waste.

---

‡ Note: as new information becomes available any other taxa / species in which SARS-CoV-2 transmission is demonstrated via natural or experimental inoculation should also be considered "potentially susceptible ".

- Follow more specific guidelines produced for each specific taxa group when available (see links below).

- In settings where peri-urban work is required, ensure that any onlookers from the public remain at least 10 meters away and are upwind from the work that is ongoing with the wild mammals.

These recommendations are deliberately broad to apply to multiple taxa of wild mammals. Some expert groups have developed their own recommendations (see below), which should be used in addition to these. The situation with the COVID-19 pandemic is continually evolving. As we learn more about the effects of SARS-CoV-2 in more species and transmission risks, these recommendations may change or be superseded by species or taxa-specific recommendations. As the SARS-CoV-2 will likely become endemic in human populations, it is our responsibility to prevent the same thing from occurring in the wild, free-ranging mammal species that are in contact with people.

Subject: IMPORTANT: Transportation to Ambassador's Reception

All,

There have been several inquiries. To be clear: CBEP **will not** be providing transportation to or from the Ambassador's reception this evening. You should have a hard copy of the invitation, please feel free to walk, cab, or uber to the residence address that is provided on your invitation. The reception runs from 1800-2000 and you are invited to arrive and leave at your discretion.

V/r,

Katie Leahy

"How Can Health Data and Technological Innovations Contribute to the Next-generation UHC to Ensure Global Human Security?"
Side meeting at the 2018 Prince Mahidol Award Conference

Tuesday, 30 January 2018

2:00pm-4:30pm
Lotus 10 Meeting Room, Convention Center, 22 Fl, Centara Grand Hotel at Central World

Dear Sir/Madam,

We are delighted to invite you to an event co-organized by Institute for Global Health Policy Research (iGHP), National Center for Global Health and Medicine (NCGM), Japan and "The Partnership Project for Global Health and Universal Health Coverage (GLO+UHC)" [Thailand Ministry of Public Health (MOPH)
National Health Security Office (NHSO) and Japan International Cooperation Agency (JICA)]

The event is a side meeting focusing on new approaches to making health systems person-centered, efficient, and sustainable with effective use of health data and ICT and to foster discussion among stakeholders from various sectors to promote partnerships at country and global levels.

The session outline is enclosed for your reference.

The session is open to all PMAC participants.

We would appreciate if you could kindly confirm your participation by 20 January 2018, using the online registration form here:https://goo.gl/forms/qXkf612X6nKbD7Y02

Sincerely,
Yohsuke TAKASAKI
Expert, Chief Advisor / Health Policy
The Partnership Project for Global Health and Universal Health Coverage

"How Can Health Data and Technological Innovations Contribute to the Next-generation UHC to Ensure Global Human Security?"
Prince Mahidol Award Conference (PMAC) 2018
14:00-16:30 on 30th January, 2018

1. Date and Venue

Date: 14:00-16:30 on 30th January, 2018
Venue: Lotus 10 Meeting Room, Convention Center, 22 Fl, Centara Grand Hotel at Central World

2. Backgrounds

When working towards effective and efficient Universal Health Coverage (UHC) implementation, the current trends surrounding health systems should be taken into consideration. These trends include human mobility at the global level, humanitarian crises, epidemiological and demographic transitions, emerging and re-emerging infectious diseases, and the ever-increasing needs for quality and equitable health-care services. Accordingly, health systems should be strengthened at multiple levels (community, national, regional and global), and person-centered quality health care needs to be delivered to everyone.

Novel approaches as well as mobilization of existing resources are necessary for planning effective and reliable health systems. Strategic utilization of health data and information and communication technology (ICT) is a significant measure in this era of sustainable development goals (SDGs). These technical innovations can potentially help design a next-generation UHC, to establish healthy and sustainable future societies. Stakeholders from different sectors should ideally be able to collaborate to deliver person-centered quality health care with effective use of health data. However, in reality, obstacles such as conflicts of interest among stakeholders need to be surmounted.

In this side meeting, speakers from diverse sectors will share their experiences and discuss new strategies to design health systems with effective use of health data that could ensure human security at individual levels irrespective of their locations; how to overcome challenges in collaborating with stakeholders; and global partnerships expected from the perspective of global human security.

3. Objectives

- To share knowledge of new approaches to making health systems person-centered, efficient, and sustainable with effective use of health data and ICT.
- To foster discussion among stakeholders from various sectors to promote partnerships at country and global levels.

4. Expected outcome

- The role of health data in making health systems person-centered, efficient, and sustainable are understood by audiences.
- Stakeholders from various sectors would be able to identify the key factors in promoting partnerships at national and global levels.

5. Meeting agenda

14:00-16:30 on 30th January, 2018

14:00-14:07	Welcome Remarks (Eiji Hinoshita, Director-General, Bureau of International Health Cooperation, NCGM)
14:07-14:22	Opening Remarks & Presentation (Manabu Sumi, Director, Global Health Policy Division, International Cooperation Bureau, MOFA, Japan)
14:22-14:29	Introduction of Thailand-Japan collaboration project (Yohsuke Takasaki, Chief Advisor, GLO+UHC)
14:30-14:45	Keynote Address 1 (Virasakdi Chongsuvivatwong, Professor, Prince of Songkla University, Thailand)
14:45-15:00	Keynote Address 2 (Hiroaki Miyata, Director, Department of Global Health Systems and Innovation, iGHP, NCGM)
15:00-15:10	Q&A Session
15:10-15:20	Coffee Break
15:20-16:20	Panel Discussion followed by a Q&A session Panelists include health data and public health specialists from various international organizations, academic institutions, and representatives from some of the ASEAN countries
16:20-16:30	Closing Remarks (Senior Official of Thailand)

6. Organizer and contact details

Subject: Update to the BPERNet Slides

Hi, everyone! We made a couple changes to the slides for tomorrow. Nothing substantive, just our approach to conducting the brief-out discussions and the order of a couple of the initial slides.

A reminder again to please be in the lobby at 0745, the bus will depart for Chulalongkorn promptly at 0800.

V/r,

Katie Leahy

Subject: BPERNet: Transportation Times and Other Useful Information (30 and 31 January 2017)

Hello, everyone! Welcome to Bangkok. On behalf of the Executive Committee (Dr. Martha Stokes and Dr. Mary Lancaster), we are so pleased that you are able to join us this week for our BPERNet planning meeting and other PMAC activities.

Please use this email as your resource for information regarding transportation, logistics, and other coordinating information for 30 January – 31 January.

30 January – BPERNet Meeting at Chulalongkorn Hospital

1. **The bus will depart from the Renaissance Hotel promptly at 0800** ; please be in the lobby for head count at 0745
2. We will provide coffee and light refreshment during the meeting; you will take lunch at one of the many canteen options at the hotel; please bring

about 200 - 300 thai baht (~10 USD) for lunch

31 January – PMAC / BPERNet Field Trip

1. **The bus will depart from the Renaissance Hotel promptly at 0630** ; please be in the lobby for head count at 0615; please make sure that you are on time, as we are caravanning with a delegation from the Centara Hotel and will receive a police escort to move us quickly through traffic
2. We will provide a box breakfast for the bus ride
3. Please make sure that you dress appropriately for this field trip; we strongly suggest covered shoes and loose, comfortable clothing; in addition to this mode of dress we also suggest that you bring accompaniments for spending a day outdoors amongst bat roosts; such as:
    a. Hat
    b. Sunscreen
    c. Sunglasses
    d. Bug spray
    e. Water bottle

We will provide information regarding the Ambassador's reception at the close of tomorrow's meeting.

Again, we are so excited to have you all here. Please do not hesitate to reach out to me or Megan Hudson (copied) if you have any questions.

V/r,

Katie Leahy

Today's Agenda

0830 – 0840	Welcoming Remarks and Group Photo
0840 – 0900	Orientation and Meeting Context
0900 – 1000	Facilitated Focus Area Review and Discussion
1000 – 1015	Working Tea Break
1015 – 1115	Session 1: Focus Area Strategy Mapping
1115 – 1155	Session 1: Interactive Feedback (World Café Method)
1155 – 1215	Breakout Group Session 1 Brief-out (5-minutes / group)
1215 – 1330	Lunch
1330 – 1430	Session 1: Focus Area Strategy Mapping
1430 – 1510	Session 1: Interactive Feedback (World Café Method)
1510 – 1530	Breakout Group Session 2 Brief-out (5-minutes / group)
1530 – 1545	Working Tea Break
1545 – 1615	Close-out Discussion (next steps)

Revisit: Working Groups and Research Mentors

Working Group	Research Mentors
1. Host-pathogen biology and interactions	◦ Dr. Joram Buza ◦ Dr. Vivek Kapur ◦ Dr. DeeAnn Reeder ◦ Dr. Gavin Smith
2. Pathogen surveillance, diagnostic capacity, and epidemiology	◦ Dr. Catalino Demetria ◦ Dr. Jon Epstein ◦ Dr. Tamar Kutateladze ◦ Dr. Abel Wade ◦ Dr. Keti Sidamonidze
3. Ecology setting	◦ Dr. Paul Cryan ◦ Dr. Tigga Kingston ◦ Dr. Robert Kityo ◦ Dr. Rebekah Kading ◦ Dr. Eiichi Hondo
4. Human-bat interactions	◦ Dr. Kevin Olival ◦ Dr. Ian Mendenhall ◦ Dr. Supaporn Wacharapluesadee ◦ Dr. Lela Urushadze ◦ Dr. Nesreen Alhmoud

Cross-cutting Themes

Communication, outreach, and advocacy of group goals to decision-makers and policy-makers

List of recommendations for standardized language

Database management / IT

Modeling

Workforce development

Education and outreach with humans that live in close proximity to bat communities

NOTE: may want to consider other experts; e.g., working with statisticians (for modeling) and professional PR individuals (for communications); and expertise from social scientists

Note: these were edited by the SC during the PMAC side meeting (30 January 2018)

Working Group 1: Host / pathogen biology and interactions

Bat physiology (integration opportunity with Group 3 – Ecology)

Bat immunology

Bat pathology and pathophysiology

Bat pathogen community ecology (co-infections, co-morbidities)

Distribution of pathogens among species

Develop modeling approaches for host dynamics and epidemiology (individual to populations; and seasonality . . . integration opportunity with Group 2)

Group Challenges:

1. Very few reagents and cell lines
2. Lack of animal models

Note: these were edited by the SC during the PMAC side meeting (30 January 2018)

Working Group 2: Pathogen surveillance, diagnostic capacity, and epidemiology

Molecular epidemiology

Serological surveillance integrated with education and outreach

Distribution of pathogens geographically and phylogenetically

Detection, diagnosis, and reporting of bat-associated pathogens

Establish commonly used guidance on sampling

Challenges:

1. Workforce capacity
2. Sequencing the antigenic region or whole genomes
3. Integration with conservation communities and stakeholders

Note: these were edited by the SC during the PMAC side meeting (30 January 2018)

Working Group 3: Ecology setting (bat, domesticated animals, and wildlife interface)

Bat behavior (social ecology), distribution, and movement

Domesticated animals and wildlife behavior, distribution, and movement impact on interaction with bats.

The effect of anthropogenic disturbance and modification on pathogen dynamics and spillover risk

Bat population structures

Vector ecology

Acoustic surveys

Bat taxonomy

Effects of seasonality

Challenges:

1. Sampling protocol and common process for encountering new species
2. Identification and taxonomy issues

Note: these were edited by the SC during the PMAC side meeting (30 January 2018)

Working Group 4: Human-bat interactions

Human behavioral risk characterization
- Encroachment effects
- Climate change effects
- Opportunity for interaction with Group 3 on anthropogenic disturbance)

Hunting and commodity chain (e.g., bushmeat, guano, and pet trade)

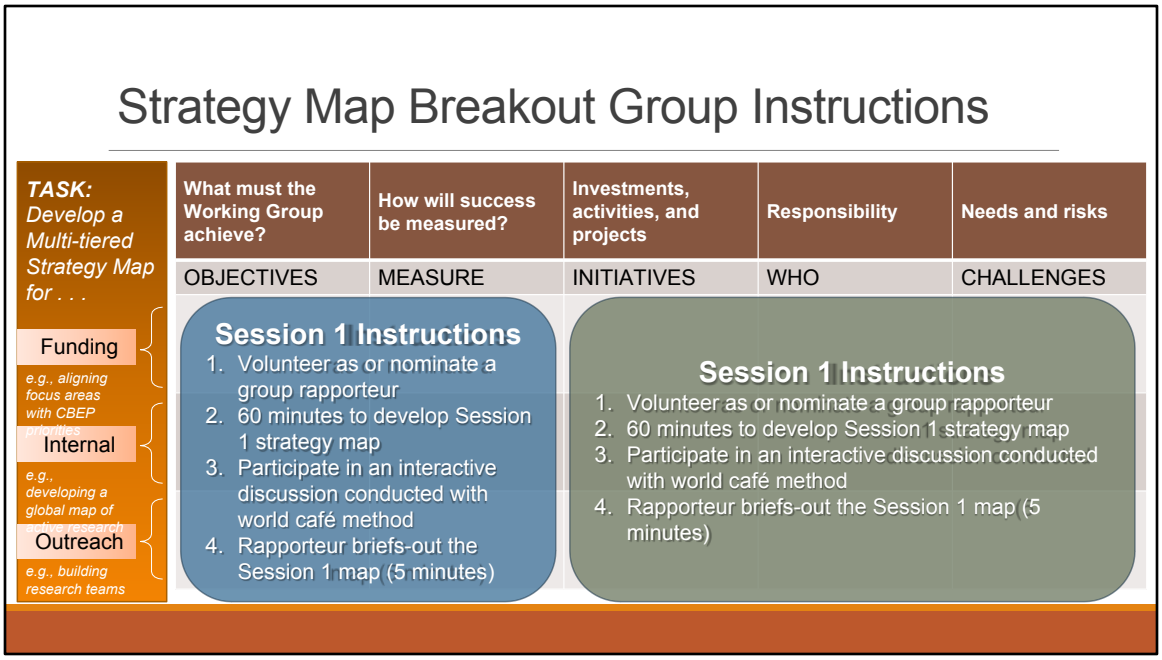
Ecotourism

Interactions in human dwellings

Influence of agricultural practices (consider all alspects; e.g., flora aspect and livestock practices, and use of guano in fertilization)

Note: these were edited by the SC during the PMAC side meeting (30 January 2018)

Strategy Map Breakout Group Instructions



Interactive Discussion Instructions (using world café method)

Will take place immediately following each 60 minute breakout group session

- Rapporteurs should stay in their focus areas to collect comments;
- At the buzzer, leave your group and rotate to a group of your choice and interact with the group rapporteur;
  - Ask questions
  - Provide feedback
  - Make additions to the established strategy
- At the next buzzer (after 10 minutes), leave your group and rotate to a new group and do the same;
- At the next buzzer, leave your group and rotate to a new group and do the same
- At the next (and final buzzer), leave your group and rotate back to your focus area for a quick discussion (10 minutes) to prepare your 5-minute outbrief

Session 1: Focus Area Strategy Mapping

Dear all,

The attached typeset proof of our paper just arrived, and I have two days to reply.*Acceptable corrections are limited to author name or affiliation errors, misleading scientific inaccuracies, and printer's errors.* Change requests beyond these items will not be accepted.

Please quickly double check your name and affiliation, and if you find any errors please let me know by COB tomorrow. If I don't hear back, I'll assume it is correct.

Our article currently has a provisional scheduled publication date of Sep 03, 2020. Please note that our paper will **remain under a strict press embargo** until 2 PM Eastern Time (US) on the date of publication, so please don't circulate or tweet! :)

Thanks!
Kevin

Dear Dr. Olival,

We are pleased to inform you that your manuscript 'Title - Possibility for reverse zoonotic transmission of SARS-CoV-2 to free-ranging wildlife: a case study of bats

Short Title - Possibility for SARS-CoV-2 transmission from humans to free-ranging bats' has been provisionally accepted for publication in PLOS Pathogens.

Before your manuscript can be formally accepted you will need to complete some formatting changes, which you will receive in a follow up email. A member of our team will be in touch with a set of requests.

Please note that your manuscript will not be scheduled for publication until you have made the required changes, so a swift response is appreciated.

IMPORTANT: The editorial review process is now complete. PLOS will only permit corrections to spelling, formatting or significant scientific errors from this point onwards. Requests for major changes, or any which affect the scientific understanding of your work, will cause delays to the publication date of your manuscript.

Should you, your institution's press office or the journal office choose to press release your paper, you will automatically be opted out of early publication. We ask that you notify us now if you or your institution is planning to press release the article. All press must be co-ordinated with PLOS.

Thank you again for supporting Open Access publishing; we are looking forward to publishing your work in PLOS Pathogens.

Best regards,

Abstract

The COVID-19 pandemic highlights the substantial public health, economic, and societal consequences of virus spillover from a wildlife reservoir. Widespread human transmission of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) also presents a new set of challenges when considering viral spillover from people to naïve wildlife and other animal populations. The establishment of new wildlife reservoirs for SARS-CoV-2 would further complicate public health control measures and could lead to wildlife health and conservation impacts. Given the likely bat origin of SARS-CoV-2 and related beta-coronaviruses (β-CoVs), free-ranging bats are a key group of concern for spillover from humans back to wildlife. Here, we review the diversity and natural host range of β-CoVs in bats and examine the risk of humans inadvertently infecting free-ranging bats with SARS-CoV-2. Our review of

the global distribution and host range of β-CoV evolutionary lineages suggests that 40+ species of temperate-zone North American bats could be immunologically naïve and susceptible to infection by SARS-CoV-2. We highlight an urgent need to proactively connect the wellbeing of human and wildlife health during the current pandemic and to implement new tools to continue wildlife research while avoiding potentially severe health and conservation impacts of SARS-CoV-2 "spilling back" into free-ranging bat populations.

Spillover of pandemic viruses

The threat of emerging infectious diseases (EIDs) to wildlife health and biodiversity conservation is recognized [1], but cross-species transmission of novel pathogens, or spillover, is typically viewed in the specific context of originating in a wildlife reservoir and transmitting to humans [2]. Research assessing EID risk has typically focused on identifying geographic regions [3, 4] and wildlife species [5–7] whereby spillover of zoonotic diseases into humans is most likely. Among recent pandemic zoonotic viruses, some have no evidence of transmission back to wildlife or domestic animal populations after establishment in people (e.g., human immunodeficiency virus, which causes acquired immunodeficiency syndrome), while others have repeatedly crossed species boundaries (e.g., pandemic H1N1 influenza A virus) [8, 9]. Evidence of "reverse zoonotic" transmission, sometime referred to as "spillback," from people to wildlife and domestic animals is widespread [9]; however, systematic surveys to determine the proportion of EIDs that spill back into novel wildlife hosts are lacking. Infection of bats by viruses of probable human origin has been recorded only twice [10, 11], and further transmission [12], or spread to a wider bat population, has not been recorded.

In December 2019, a novel coronavirus was detected from a cluster of 41 atypical pneumonia cases in Wuhan, China, and has since spread to cause a pandemic with significant global morbidity, mortality, and economic impact [13]. Phylogenetic evidence suggests that this virus, severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), and the clade of SARS-related coronaviruses (SARSr-CoVs) that it belongs in evolved in Old-World bats of the family Rhinolophidae [14–16]. There is no epidemiological evidence of direct or indirect transmission of SARS-CoV-2 from bats to people, but a full genome of its closest known relative (with 96.2% sequence similarity) was reported from an Intermediate Horseshoe Bat (*Rhinolophus affinis*) sampled from Yunnan province, China, in 2013 [17]. The timing of SARS-CoV-2 spillover from bats and any involvement of intermediate host species remain undetermined [18, 19]. The United States currently has the highest number of confirmed human cases of COVID-19, the disease caused by SARS-CoV-2. The consequences of this pandemic are many and include the possibility of SARS-CoV-2 transmission from humans to free-ranging wildlife populations. Given the likely bat origin of SARS-CoV-2, free-ranging bats are a key group of concern for spillover from humans. Humans frequently handle and come into close contact with North American temperate-zone bats during the course of ecological research, wildlife rehabilitation, wildlife/pest control, and disease investigations. Anticipating the need for similar risk assessments across many potentially vulnerable species of wildlife and domesticated mammals globally, we here examine the possibility of humans inadvertently infecting free-ranging North American bats with SARS-CoV-2. We further discuss the possible public health and wildlife conservation consequences of SARS-CoV-2 becoming endemic in bats outside its natural host range.

Threats of SARS-CoV-2 to North American bats

The pandemic spread of SARS-CoV-2 may directly or indirectly threaten North American bat populations in at least three different ways. First, SARS-CoV-2 might infect any of the diverse

and historically isolated 40+ endemic species of temperate-zone North American bats, with or without causing disease, morbidity, and mortality. Second, SARS-CoV-2 might infect and become established in one or more North American bat species, creating novel reservoirs capable of causing human infections (e.g., bat rabies lyssaviruses in the New World [20]). Third, if SARS-CoV-2 infection persists in North American bats of one or more species, it could potentially evolve or recombine with endemic viruses [19, 21] to become more pathogenic or infectious to humans or other animals. In addition to new public health challenges, the latter outcomes could quickly shift public perception of bats from mostly beneficial wildlife with associated disease risks that are manageable to bats posing unacceptable disease risks to human and animal health. Such a shift could increase the likelihood of negative human–bat interactions and conflicts, as well as undermine decades of concerted science, conservation, and education efforts aimed at conserving these valuable animals [22–24]. The potential threat of SARS-CoV-2 transmission from humans to other animals applies to many species of wildlife and domesticated mammals, but the likely bat origin of SARS-CoV-2 and the current threats to bat populations due to another disease in North America influenced us to focus this review on bats.

Lessons from an epizootic—Susceptibility of North American bats to an introduced pathogen

SARS-CoV-2 is not the first pathogen with the potential for inadvertent spread from people to North American bats. The COVID-19 pandemic follows the arrival of a fungal pathogen (*Pseudogymnoascus destructans*) that as early as 2006 began infecting hibernating bat populations in North America, spreading within and among species to alter the evolutionary trajectory of the continent's bats [25–28]. Genetic analyses indicate that *P. destructans* was introduced to North America [29], in our opinion likely by movement of humans or materials contaminated with fungal spores. White-nose syndrome (WNS), the disease caused by *P. destructans*, remains the only documented bat epizootic to cause multiyear, widespread mass mortality [30], although short-term bat die-offs have been also linked to Lloviu virus in Europe [31]. WNS has killed millions of North American bats, affected populations of at least 12 species of 3 genera, and has already spread across half of the US and Canada (whitenosesyndrome.org, accessed 11 May 2020). Effective methods to mitigate WNS spread and impacts remain elusive despite substantial research effort, and targeted mitigation actions have had limited success against its impacts [32]. It took years of concerted international scientific effort to identify the cold-growing fungus, determine that it likely originated somewhere in the temperate zones of Europe or Asia, understand its mechanisms of infection and pathogenicity, develop strategies to limit accidental translocation, and track its rapid spread through an immunologically naïve continental assemblage of hibernating bats [33–35].

The devastating impact of WNS on a diverse group of North American bats likely resulted from evolutionary isolation of the continent's bat fauna from other parts of the world for millions of years, despite other species of *Pseudogymnoascus* being present. Bats in both Europe and Asia can become infected by *P. destructans* but do not suffer mass mortality from WNS [36, 37]. The bat fauna spanning the higher latitudes of North America (in the US and Canada) is composed almost entirely of endemic species belonging to the family Vespertilionidae. Vespertilionid bats occur globally but likely originated and diversified in North America tens of millions of years ago before dispersing to other continents [38, 39]. No extant species of bat in the Americas also occurs outside of the Americas [40, 41], and no bats migrate across the Pacific or Atlantic Oceans [42, 43]. The WNS epizootic demonstrates that a large proportion of these historically isolated bats can be vulnerable to a pathogen introduced from another

continent during a single event. Additionally, bats already in a physiologically stressed condition due to WNS or other pressures may be more susceptible to viral infection, experience exacerbated disease outcomes, and/or experience increased viral shedding [44, 45]. The COVID-19 pandemic resembles WNS with respect to potential spread of a pathogen from another continent through interconnected, multispecies assemblages of North American bats that might be immunologically naïve and highlights deficits in our understanding of temperate-zone bat pathogens in North America.

Gaps in understanding global patterns of Bat–CoV diversity, evolution, and host range

Bats are among the world's most diverse mammals (comprising approximately 1,400 species [46]), and the global distribution and diversity of CoVs in bats proportionally reflects that of their hosts [47, 48]. Available evidence indicates that bats are natural reservoirs of CoVs, some of which have the potential to cause diseases in humans, domesticated animals, and wildlife [17, 47, 49–59]. Coronaviruses appear to have ancient and ancestral relationships with bats, diversifying globally through a process of within-host evolution and cross-taxonomic host-switching events [47, 59–61]. Bats are the likely mammalian progenitor hosts of all alpha (α-) and beta (β-) CoVs [58, 59, 62, 63] and potentially all coronaviruses [60]. Alpha-CoVs of likely bat origin include the causative agent of swine acute diarrhea syndrome (SADS), which caused mass mortality of over 25,000 piglets on farms in Guangdong province, China [57], and a variant strain of porcine epidemic diarrhea virus (PEDV) that spread rapidly from China in recent decades and caused mass piglet mortality in multiple US states [64]. Human CoVs NL63 and 229E also likely had their evolutionary origins in bats [59, 65]. Two recent human disease epidemics (severe acute respiratory syndrome [SARS] and Middle East respiratory syndrome [MERS]) and now the current COVID-19 pandemic are caused by viruses that probably originated from β-CoVs circulating in bat populations in regions where outbreaks occurred [17, 19, 50–54, 58, 66–68].

The emergence of diseases like SADS, PEDV, SARS, MERS, and now COVID-19 strongly indicates a close association between CoVs that become pathogenic in humans and the wildlife reservoirs from which they originate [17, 50–54, 67]. The evolutionary relationships of CoVs within bats are consistent with geographically structured transmission cycles, with occasional transmission among related bat species [47, 58, 69]. These phylogeographic factors are also universal determinants of viral sharing among all mammals [70]. However, bat–virus association patterns can be particularly difficult to discern because bats often roost together in multispecies aggregations that can facilitate viral sharing, with each species capable of harboring multiple CoV lineages [47, 58, 68, 71]. Host shifts from bats to more divergent taxa are more difficult to predict—firstly, because the potential host breadth for many CoVs is broad [55, 56, 60, 72], and secondly, because host susceptibility and onward transmission involve complex, multistage processes [2, 12]. Bat–CoV associations likely remain substantially undersampled and understudied in temperate-zone North America [47, 71, 73, 74].

Are viruses like SARS-CoV-2 already present in North American bats?

Our examination of CoV evolutionary lineages and global distribution patterns of the diversity of bat species they infect suggests that temperate-zone North American bats could be immunologically naïve to infection by viruses like SARS-CoV-2. Alpha and β-CoVs have been detected in bats on most continents, sometimes with both types occurring in bats of the same species [58, 68]. However, an exception to this pattern is the lack of published evidence that β-CoVs

infect bats of temperate-zone North America, despite several search efforts which used methods suitable to detect both α- and β-CoVs [59, 71, 74, 75]. Multiple novel α-CoVs have been detected and described in vespertilionid bats of the US and Canada, infecting species both living in close contact with humans and in remote wild areas [59, 71, 74–76]. However, SARSr-CoVs and β-CoVs of the viral subgenus *Sarbecovirus* have thus far been detected almost exclusively in species of the Old-World Chiropteran suborder Yinpterochiroptera (Fig 1A) [47, 58, 69]. The few exceptions to this pattern are the detection of novel Clade 3 and Clade 1 *Sarbecovirus* (*sensu* [53]) viruses in the wrinkle-lipped free-tailed bat (*Mops plicatus*, family Molossidae) in China [77] and the vespertilionid Leisler's noctule (*Nyctalus leisleri*) cohabiting a Bulgarian cave during autumn with several species of rhinolophids in which other SARSr β-CoVs were concurrently detected, suggesting cross-species infections (Fig 1A) [78]. Putative detections of a Clade 1 *Sarbecovirus* were also reported from guano samples of the vespertilionid brown long-eared bat (*Plecotus auritus*) and the molossid European free-tailed bat (*Tadarida teniotis*) on Sardinia, where the same novel β-CoV was described in the greater horseshoe bat (*R. ferrumequinum*) [79].

Viruses in the β-CoV subgenera *Hibecovirus* and *Nobecovirus* also have been reported mostly from Old-World bat families Rhinolophidae, Hipposideridae, Rhinonycteridae, and Pteropodidae, except for novel viruses of the latter subgenus detected in four species of the vespertilionid genus *Scotophilus* in Asia and Africa (Fig 1B and 1C) [47, 58, 69].

Bat β-CoVs of the subgenus *Merbecovirus* (MERS-related lineages) occur in a greater diversity of bat families and across more global regions than the other subgenera (Fig 1D) [47, 58, 69]. These widely distributed MERS-like viruses can cause disease in humans (e.g., MERS) and notably appear to be the only bat β-CoVs to diversify among several families of the globally distributed suborder Yangochiroptera (Fig 1*D*) [47, 58, 69].

Lack of evidence for β-CoVs in temperate-zone North American bats

The several hundred species of extant bats spanning the Americas all belong to the suborder Yangochiroptera, which likely diverged from the Old-World suborder Yinpterochiroptera more than 50 million years ago (Fig 2) [80]. The only β-CoVs detected in the Americas to date belong to the subgenus *Merbecovirus* and appear restricted to two exclusively Neotropical bat families (Phyllostomidae and Mormoopidae) and one that is globally distributed (Molossidae). Distinct CoV lineages in the subgenus *Merbecovirus* were described from three species of *Pteronotus* (family Mormoopidae), four species of *Artibeus*, and Seba's short-tailed bat (*Carollia perspicillata*; family Phyllostomidae) from tropical regions of Mexico [47, 81]. Novel β-CoVs of the subgenus *Merbecovirus* were detected in two neotropical bat species of the family Molossidae: Wagner's bonneted bat (*Eumops glaucinus*) in southern Brazil and the broad-eared free-tailed bat (*Nyctinomops laticaudatus*) in southern Mexico [81, 82]. In vitro infections have shown that primary kidney cells from the Jamaican fruit-eating bat (*Artibeus jamaicensis*) can be infected with MERS-CoV, and virus replication and shedding was reported in experimentally infected bats of this species but without obvious clinical signs of disease [83]. Similar to the evidence for natural invasion of bat rabies viruses among New World bats [84], available evidence suggests β-CoVs may have arrived through South America and have long been evolving in Neotropical bats. Although some bat hosts of *Merbecoviruses* overlap geographically with species of temperate-zone North American bats, none occur outside of the Neotropics. Sampling has been limited, but we are not aware of any published detections of *Merbecoviruses* or any other β-CoVs in temperate-zone North American vespertilionid bats.

Our inference of true patterns of CoV occurrence and distribution in bat populations is limited by uneven global sampling. Yet SARSr-CoVs (*Sarbecovirus* spp.), a focus of many

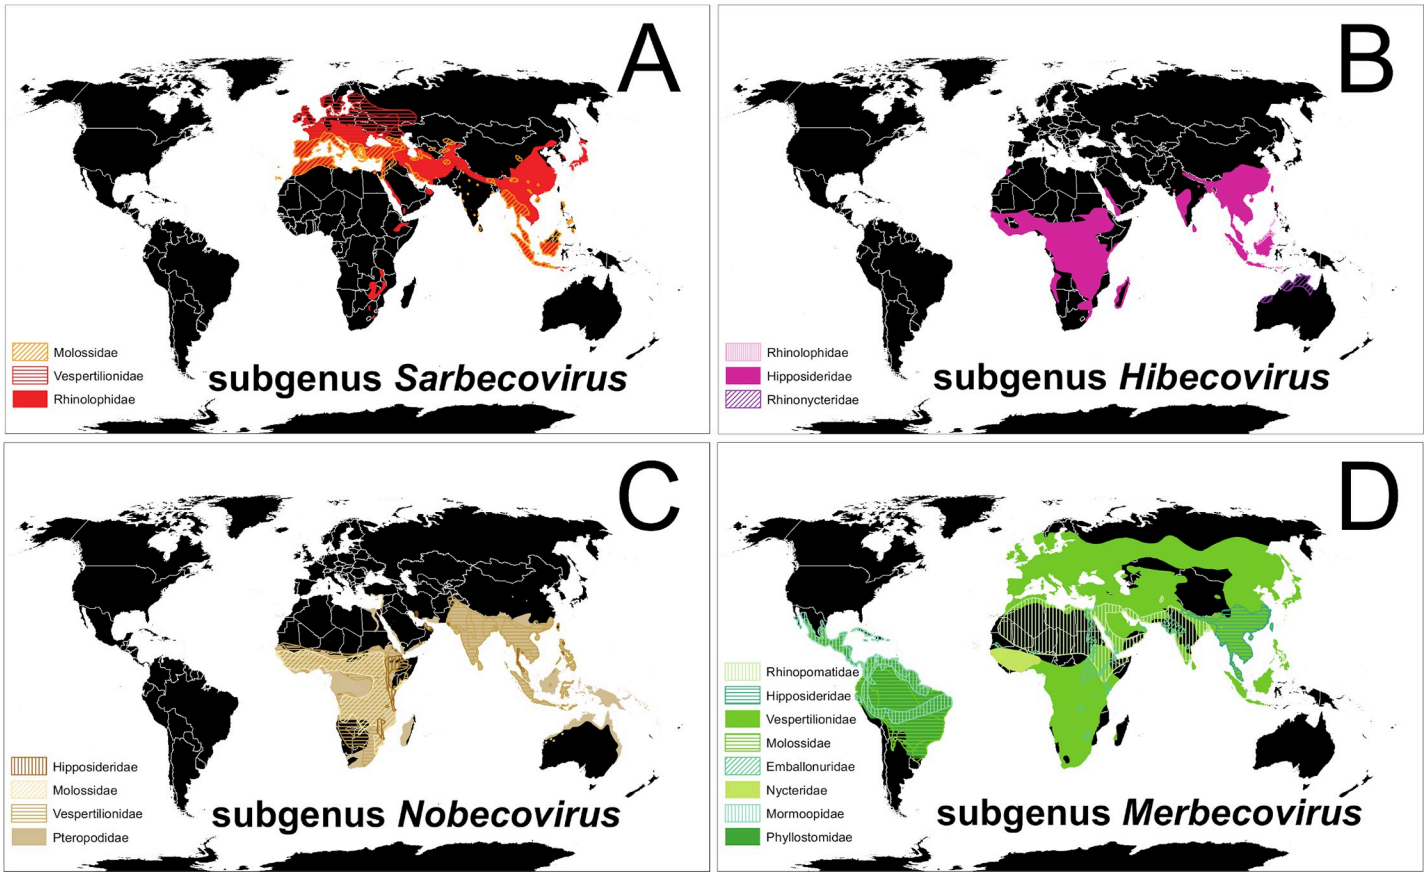

Fig 1. Global patterns of bats and associated β-CoVs. (A) Red-shaded distributions of bat species in which SARS-related β-CoVs of the subgenus *Sarbecovirus* have been detected; (B) pink-shaded distributions of bat species known to host β-CoVs of the subgenus *Hibecovirus*; (C) brown-shaded distributions of bats in which β-CoVs of the *Nobecovirus* lineage have been detected; and (D) green-shaded distributions of bats known to host MERS-related β-CoVs of the subgenus *Merbecovirus*. Different colors and shade styles within each panel represent different families of bats. A data table that includes all known bat species associations for each β-CoVs subgenus and peer-reviewed citations is available at US Geological Survey data release https://doi.org/10.5066/P9U461PJ. *Maps created using ArcMap (ESRI, Redlands, California, United States of America) and bat ranges derived from spatial data on terrestrial mammals from the International Union for the Conservation of Nature (IUCN 2020. The IUCN Red List of Threatened Species. January 2019 [version 6.2]. https://www.iucnredlist.org; Downloaded on 11 April 2020).* β-CoV, beta-coronavirus; MERS, Middle East respiratory syndrome; SARS, severe acute respiratory syndrome.

https://doi.org/10.1371/journal.ppat.1008758.g001

surveillance efforts, have been almost exclusively documented in Old-World Yinpterochiroptera. SARSr-CoVs were only found in the ultra-diverse and globally distributed bat suborder Yangochiroptera under conditions with plausible transmission from co-roosting *Rhinolophus* sp. bats [53, 85]. This absence of evidence for SARS-like β-CoVs in yangochiropteran bats in general, and in temperate-zone vespertilionid bats of North America in particular, likely represents a unique biogeographic pattern driven by underlying factors of host susceptibility or life history. These observations also point to the susceptibility of vespertilionid bats under circumstances of SARSr-CoV environmental exposure and that they may not be naturally immune to these viruses.

Bats rank among the most ecologically important mammals and play varied roles in most of Earth's ecosystems; bats pollinate and disperse seeds of numerous plants in tropical regions, and all over the world, bats are primary nocturnal predators of flying insects [23, 24]. Across the Holarctic, chiropteran species diversity is greatest among hibernating vespertilionid bats. At least 25 of the ecologically diverse vespertilionid species of bats in the US and Canada hibernate [86], which might influence their susceptibility to or interactions with viruses, as has been

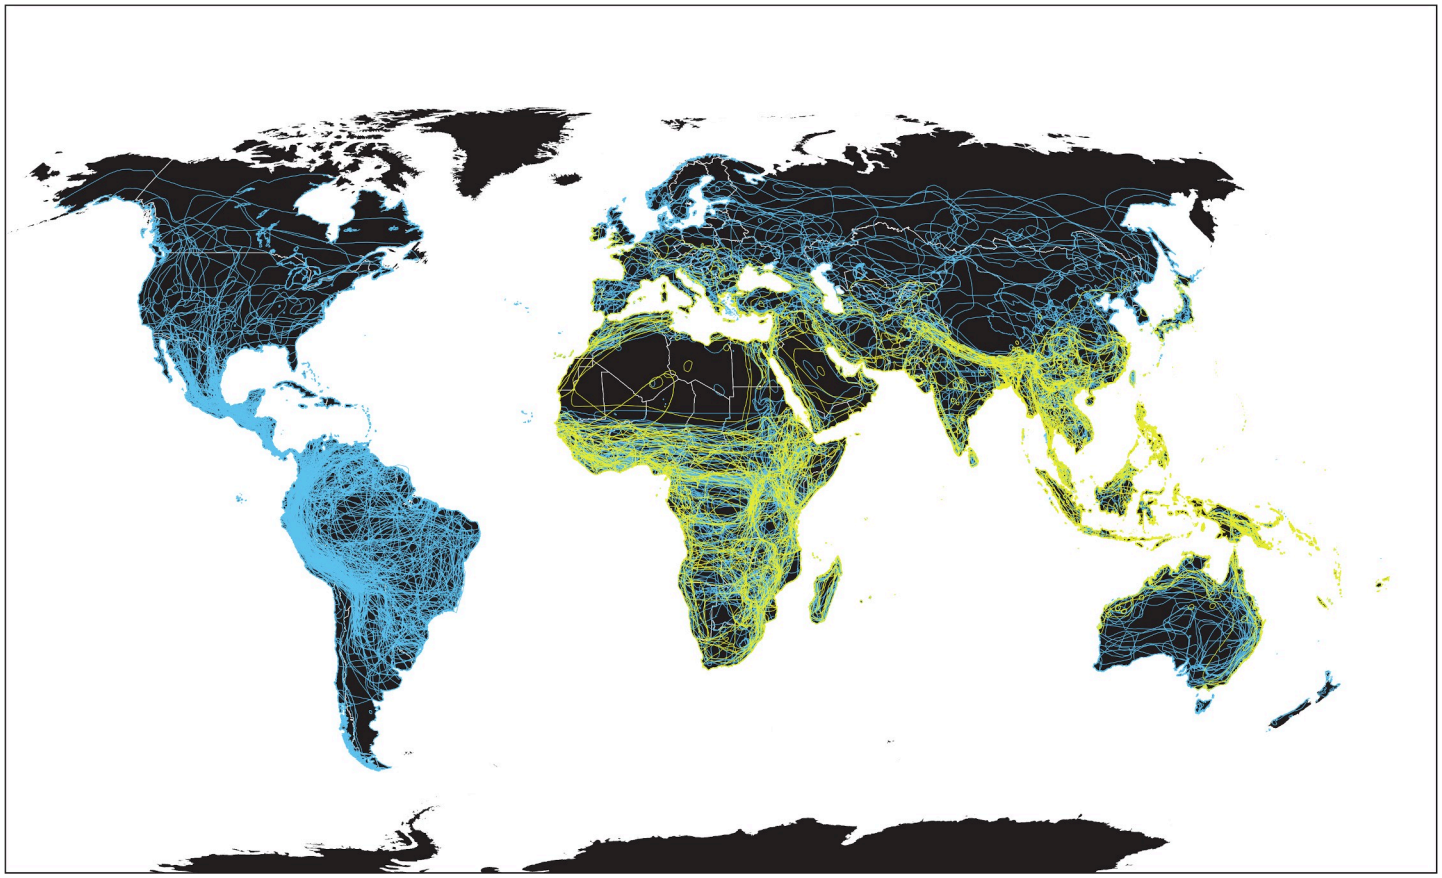

Fig 2. Old-World and New-World bats. Overlapping species distribution outlines of bats in the globally distributed suborder Yangochiroptera (blue) and Old-World Yinpterochiroptera (yellow). *Maps created using ArcMap (ESRI, Redlands, California, USA) and bat ranges derived from spatial data on terrestrial mammals from the International Union for the Conservation of Nature Red List of Threatened Species, January 2019 [version 6.2]. https://www.iucnredlist.org; Downloaded on 11 April 2020.*

https://doi.org/10.1371/journal.ppat.1008758.g002

postulated for common vespertilionids infected with α-CoVs and rabies virus [44, 87–89]. Hibernation strategies vary among species of bats (e.g., degree of sociality, thermoregulatory behaviors, habitat selection) [90], but bat body temperatures during hibernation generally remain consistently below 10° C for periods lasting 7–9 months per year [91], providing a potential mechanism to limit viral replication and spread [92]. Experimental studies to assess the ability of SARS-CoV-2 or other β-CoVs to survive and replicate in bats (cell lines and individuals) at low temperatures [92, 93] would provide additional insight into risk of reverse zoonosis. However, appropriate tools for studying such possibilities are lacking, particularly immortalized cell lines from several hibernating, vespertilionid bats [59]. These tools would also enable interrogation of other physiological features of vespertilionids that may influence susceptibility, such as receptor-binding affinity and the expression of receptors across tissues. Scientists did not discover and isolate the obligately psychrophilic fungus that causes WNS until they collected samples in bat hibernation sites and moved culture dishes for incubation into laboratory refrigerators [25]. Similar innovative explorations outside the typical temperature conditions of laboratory experimentation could help assess the risk of SARS-CoV-2 infecting the more than two dozen species of bats in the US and Canada that hibernate to survive harsh temperate-zone winters.

Proactively connecting the wellbeing of human and bat populations

Scientists have long recognized the risk of pathogen spillover from humans to bats [94–96], but bat researchers in North America have not systematically addressed this risk prior to WNS. Outside of reservoir host studies, few bat researchers studied infectious diseases in bats before WNS emerged in 2007 [73] nor studied bat viruses (other than rabies) before bats were retrospectively connected to the SARS epidemic [15, 66, 97]. Fortunately, bat and wildlife disease researchers recently began addressing these knowledge gaps in more detail [7, 97, 98]. Possible explanations for why bats might host particularly pathogenic viruses include characteristics of their life history (e.g., long-lived, wide ranging, multispecies aggregations, daily and seasonal heterothermy) [97], unique physiology for repairing their damaged DNA [99], unique ability to suppress some of their innate immunity pathways [100–105], high species diversity [48], and unmatched metabolic range and high body temperatures during flight [106]. Bats also cryptically come into close contact with humans, increasingly in urban and periurban settings as a result of native habitat loss, often crossing human–wildlife interfaces [107–113].

Except for *Lyssavirus* infections, bats rarely show substantial signs of sickness from the same pathogens that cause virulent disease in humans. Bats cope with viral infections in ways that we do not yet fully comprehend, but learning how they do so may reveal important insights to develop therapeutics and ultimately to protect human health [103–105]. In vitro and laboratory studies demonstrate that bats can specifically regulate naïve immunity pathways to effectively cope with viral infection [114]. For example, dendritic cells generated from the bone marrow of the Egyptian rousette (*Rousettus aegyptiacus*) infected with Marburg virus down-regulate immune-stimulatory pathways and maturation of cells targeted by the virus while up-regulating pathogen-sensing pathways [115]. Unique bat immune regulation may occur with MERS-CoV infection, at least under experimental conditions [101]. Egyptian rousette bats experimentally challenged with SARS-CoV-2 by intranasal inoculation became transiently infected, shed virus, and one cohoused bat became infected but showed no clinical signs of disease other than rhinitis [116]. Our potential lack of understanding of clinical signs of illness in bats and the cryptic habits of many species also generally inhibit our ability to easily detect spillover of pathogens from human to bat populations. This may add to uncertainty about cross-species transmission and dispersal of CoVs among human and animal communities. Laboratory findings suggest human viruses that likely originated in bats, such as HCoV-NL63, are capable of infecting bat cells, at least in vitro [59]. SARS-CoV-2 and other CoVs have some of the longest genomes among all RNA viruses, and despite having specialized RNA proofreading machinery [117, 118], they are still prone to recombination and copy errors in hosts, sometimes resulting in functional adaptations (e.g., altered receptor binding capacity or temperature adaptation of enzymes) [119]. CoVs can even recombine with functional fragments of other virus families, such as when a bat-derived CoV gained a functional gene from a reovirus [21]. Spillover of SARS-CoV-2 from infected humans to North American bats they handle or come in close contact with could lead to the virus becoming either less or more pathogenic to bats or other wildlife, domesticated animals, or humans through genetic mixing in one or more novel hosts. The public health and conservation consequences of a more virulent virus could be severe, whereas genetic mixing in a bat host that resulted in a less-virulent virus might go unnoticed.

Need for an interdisciplinary response

Effectively managing risks of human disease caused by emerging zoonotic pathogens and ensuring the health and conservation of wildlife species that are potential reservoirs of those

disease agents can be synergistic goals under a One Health framework. Spillover risk (from or to wildlife) is often greatest in disturbed ecosystems where there is an elevated frequency of human–wildlife interactions or disruption of ecological patterns [3, 120–124]. Thus, effective bat conservation and management requires understanding both pathogens that cause disease in bats, as well as human activities and ecological contexts that increase direct and indirect interactions with bats that could present health risks [2]. Furthermore, fear-based reactions to disease risk from wildlife, such as culling infected bat populations or indiscriminate killing, often have negative unintended consequences for the interconnected health of both humans and bats (e.g., culling of bats in a Uganda mine led to a more than doubling of Marburg virus prevalence in the bats living there) [30, 125–127]. Temperate-zone vespertilionid bats inhabiting human dwellings in the US and Canada represent a particularly relevant human–wildlife interface, in which conservation and management actions to proactively address the potential consequences for pathogen spillover are worth careful consideration [73].

Conservation-compatible surveillance of bat viruses has demonstrated the potential for mutually beneficial collaboration between public health scientists and conservation stakeholders [94, 113, 125, 128, 129]. Disease-focused studies that integrate ecological principles into a rigorous study design provide the most informative context to interpret bat–virus associations and patterns of richness globally [130–132]. Assessing the risks of SARS-CoV-2 spillover into North American bats presents a timely opportunity to form multidisciplinary scientific teams that include experts on emerging infectious diseases and ecologists with expertise on North American bats [128]. Scientists researching emerging infectious diseases can benefit from sampling opportunities and methods that bat researchers have developed for observing, counting, and noninvasively sampling bats [73, 133]. Bat researchers can learn about human and animal health monitoring and supporting laboratory methods, including biosafety, secure handling/transport of CoV-positive samples, and training in the proper use of personal protective equipment (PPE) from professionals with expertise in veterinary and medical sciences [113, 131, 134, 135]. A shared goal of all stakeholders is to identify and implement simple, widely available diagnostic tests for detecting SARS-CoV-2 infection that are species-independent, practical for field and laboratory use, highly specific and sensitive, and that do not require strict biosafety containment [136]. All investigators can also work together to develop mutually beneficial goals, such as joint risk communications to the public with effective and balanced messaging about bat populations and higher risk activities for human–bat contact.

Adopting a precautionary approach in the face of global COVID-19 transmission among human populations, national and international wildlife organizations have advised limiting capturing and handling of bats in the field to minimize the risk of humans infecting wild bats with SARS-CoV-2 until further assessment can be made [137, 138]. The emergence of WNS in 2007 prompted a similar surge in interdisciplinary collaboration that enabled the rapid advances already mentioned and introduced changes to guidance for PPE use and disinfection practices for bat researchers and recreational cavers. Similarly, the emergence of SARS-CoV-2 and other viruses will likely alter the status quo of bat research, emphasizing the need to carefully weigh risks and benefits of wildlife research in the context of population-altering diseases. For example, PPE, including respiratory protection, is a standard practice adopted by many bat virus researchers but by few others studying and regularly handling bats [134, 139]. The urgent research priority of a rapid, quantitative risk assessment and analysis of various mitigation options is currently underway [137, 140]. One key question is whether the proper use of optimal PPE, including bidirectional N95 or equivalent masks, along with effective risk communication and adherence to other basic biosafety practices [134, 141, 142] during field work, can significantly reduce the transmission risk of SARS-CoV-2 from humans to bats. In the interim, until new guidelines are established for handling and for close-proximity work with

bats, we have outlined gaps in our understanding of SARS-CoV-2 spillover risks at the interface between humans, domesticated animals, and free-ranging wildlife. Temporarily shifting to "hands-off" bat research methods also seems prudent, wherever possible, and could facilitate ongoing work with reduced risk.

Examples of "hands-off" research strategies

Multiple research strategies that do not involve close contact with free-ranging bats already exist for addressing critical gaps in understanding CoV diversity, distribution, evolution, and potential health effects in temperate-zone bats. For example, a combination of host-cell receptor analyses and in vitro and in vivo experimental infections across a diversity of bat and other mammalian species have helped inform potential host range expansion for SARS-CoV-2. The receptors that many CoVs use to gain access to host cells, such as angiotensin-converting enzyme 2 (ACE2) and dipeptidyl peptidase-4 (DPP4/CD26), have undergone positive selection in bats, resulting in diverse and recombinant CoV strains [72, 143]. These strains can likely bind to numerous variants of a host receptor protein and facilitate spillover into other animal species [72, 144]. SARS-CoV-2 targets and strongly binds to mammalian ACE2 cell receptors [72, 145, 146]. Beta-CoVs of the subgenus *Merbecovirus* (like those known to occur in the Americas) are not known to target ACE2 cell receptors, instead using as a receptor DPP4/CD26 or possibly other receptors [53, 144]. Current in silico predictions that bats will likely have low susceptibility to SARS-CoV-2 based on ACE2 structural analyses conflict with in vitro evidence and do not comprehensively account for ACE2 amino acid sequence variation (including intraspecific variation) that occurs within bats [17, 72, 145]. Assessing SARS-CoV-2 host range will require additional virus-host receptor binding assays in silico and in vitro [17, 53, 72, 144, 145], together with future experimental infection studies for confirmation of Koch's postulates. In addition, in vitro studies could evaluate species variability in innate immune responses. These investigations will help quantify the potential for North American bat infection and transmission among free-ranging populations.

Examples of other "hands-off" methods applicable to both bat disease and conservation research include the following: virus discovery and characterization focused on existing specimens archived in scientific museums or through partnerships and collaboration with established national bat disease monitoring or surveillance programs [147, 148]; monitoring echolocation calls to determine the occurrence, distributions, and seasonal or nightly activity patterns of bats [133, 149]; digital imaging methods for counting bats and studying physiology and behaviors in the context of disease [90, 108]; sampling guano from below bat roosts to determine bat species and individual identity, population dynamics, and daily or seasonal patterns of bat occupancy and pathogen shedding [71, 150–152]; and mathematical modeling to predict susceptible host species, virus sharing among hosts, spread patterns, or to estimate mortality in affected populations [5, 70, 122, 135]. Promising areas for innovation include making technologies for bat research more accessible to a broader global user base, less expensive, easier to use, and scientifically reproducible through open-source hardware, software, and laboratory methods [153, 154]. In addition to research, standardized field protocols and probabilistic sampling strategies are needed for monitoring bats and their viruses at continental scales (www.nabatmonitoring.org) [155, 156], as are longitudinal studies across multiple sites to better understand the ecological drivers of CoV dynamics and spillover [157]. Developing simple management tools and methods for rapidly assessing risks of virus spillover from humans to wildlife, while maintaining scientific rigor, could also help with future disease response. It might also be useful to prepare a suite of tools, protocols, and risk communication strategies for natural resource managers and public health officials to immediately deploy

while risks are being assessed. Such prepared management resources could include public outreach material and guidelines for enhanced use of PPE for those in closest contact with potentially susceptible wildlife.

Conclusion

Many questions remain about the risk of SARS-CoV-2 to naïve wildlife populations, the influences of human behavior on those risks, and the potential for establishment of new CoV reservoirs. Cross-species virus transmission events are relatively rare, requiring an infectious reservoir host to be in contact with a recipient host when conditions concurrently favor susceptibility and onward transmission [12, 113, 114]. The currently unknown, but possible and potentially high-consequence, risk of SARS-CoV-2 transmission and establishment in North American bats (or other free-ranging mammals) warrants precaution [116, 140]. Strategically managing interactions between people and potentially susceptible or at risk species can decrease the probability of cross-species virus spillover [113]. Humans that frequently handle and come into close contact with North American temperate-zone bats, such as bat researchers, wildlife rehabilitators, wildlife/pest control workers, and disease investigators, can help decrease any chances of spillover by adopting basic PPE and biosafety practices and carefully evaluating how their actions might adversely affect bat populations. We are at a critical nexus of biosecurity and natural resource conservation that will require ingenuity and diligence to continue important research on bats whilst simultaneously evaluating the ecological future of SARS-CoV-2. Our actions during this current pandemic could profoundly influence and protect the health of both humans and wildlife in North America.

Supporting information

S1 Table. Global patterns of betacoronavirus (β-CoV) associations in bats. The table lists bat species in which betacoronaviruses (β-CoVs) were detected, organized by viral subgenera and clade (for Sarbecorviruses), bat family, bat suborder, and general global region where the species of bat occurs. Reference to the published literature sources of information for each row are listed in the last column. Provided in comma-separated value (.csv) format at https://doi.org/10.5066/P9U461PJ.

Subject: Pre-event Information for BPERNet / PMAC Meetings
Attachment(s): "2018 Prince Mahidol Awards Reception_invitation_cdc.pdf","BPERNet PMAC Meeting_Revision 2[1].docx","BPERNet Meeting Prep.docx","TORFTA_BPERNet_Final.pdf","BPERN Executive Summary_rev2.docx"

All,

Good afternoon! In advance of the upcoming trip to Bangkok for our BPERNet Meeting and the PMAC conference, this email should serve as a resource of information for the meeting and the conference.

Please note that our meeting is on 30 January at 0830 at the King Chulalongkorn Memorial Hospital. The PMAC planning committee has graciously arranged for a van to pick up our group to take us to the hospital from the Rennaissance Ratchaprasong; the van will leave our hotel at 0800.

On the 31st, the PMAC planning committee has also arranged for our group to attend the EID preparedness Linking Community-Based Approach and Research to National System Field Trip (outline included in the attached agenda). The times for pick-up will be provided at our meeting on the 30th.

Regarding the Embassy reception on the 1st. By now, you should have all received an invitation from the protocol office. Please respond with your acceptance of this invitation to Protocol-Bangkok I have also attached a copy of the invitation, which you will need to print out and bring with you to the Embassy function. The embassy is within walking distance from our hotel, so we will likely coordinate as a group and walk. More information to follow.

In preparation for our meeting BPERNet Meeting, I am attaching several documents that should help everyone prepare for the discussions: 1) a copy of the read-out from our June meeting as a refresher; (2) the final TORFTA, and (3) a preparation questionnaire, which should get you thinking about the objectives-driven strategic mapping sessions that we intend to conduct.

Please let me know if you have any questions.

V/r,

Katie Leahy

Attire: Business

(Please present this invitation upon arrival)

MEETING OVERVIEW

BACKGROUND

In 2013, the Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) began leveraging, enhancing, and convening research networks to accelerate its programmatic and research driven targets and end states. CBEP uses this approach as a way to connect its active funded research projects with other projects to help influence effective change for global health security; translating data into policy. Further, by using relationship-based research networks around the globe, made up of interdisciplinary relationships, it will allow for novel and transformative scientific solutions for the world's largest infectious disease threats.

The Bat-associated Pathogen and Research Network (BPERN) is a CBEP research network that connects multidisciplinary and One Health expertise to address challenges and threats posed by bat-associated pathogens of security concern. The BPERN maintains the standards of all research networks that are supported by CBEP, in which members convene as a body of experts and researchers to: (1) share information, data, samples, and protocols; (2) coordinate research activities; (3) build training events and awareness-building workshops at all levels of decision-making authority; (4) develop community standards and best research practices; (5) create mentorship-based opportunities for students, trainees, and early-career researchers to convene, present, and share ideas; (6) establish a community of international research leaders and champions; and (7) reduce outbreak / transmission risk.

Some of the world's most deadly emerging zoonotic diseases are found in bats, including Nipah, Hendra, and Marburg viruses. There are a number of factors which make bats unique disease reservoirs, including their social behavior, distinct physiology and metabolism, ability to travel long distances, nocturnal activity, species diversity, and long life span (10-20 years, compared with a rat's average life of two years).[1] These special bat characteristics, coupled with the impact of human mediated interactions and environmental changes, create research challenges to understanding the bat's role in the global zoonotic disease ecology, which is further complicated by being difficult animals to control within a typical laboratory setting. The BPERN creates opportunities for policy makers, researchers, conservationists, funders, and students to identify community challenges, develop priority research lists and associated action plans that target needs and gaps, and work at all levels to build awareness of bat-associated disease burden and transmission risks to improve the prevention, detection, diagnosis, and reporting of pathogens of security concern.[2]

EXECUTIVE SUMMARY

On June 29, 2017, CBEP convened a group of multidisciplinary and One Health-focused research scientists, conservationists, and medical / veterinary practitioners for a one-day meeting in Fort Collins, Colorado to discuss organization and objectives for a bat-related research-based network (the complete

agenda for the meeting may be found in Annex B). The representatives and experts in attendance work in CBEP regions (a full list of participants may be found in Annex A). The meeting was held at the University Center for the Arts, at Colorado State University, in concurrence with the 2nd International Symposium on Infectious Diseases of Bats.

The meeting began with an introduction to CBEP's mission and its use of networks as a way to foster coordination across regions and build sustainable connections through research. The two CBEP science leads, Drs. Mary Lancaster and Marty Stokes, outlined their vision to enhance regional and global research capacity, which starts with a complete understanding of the existing research landscape. CBEP believes this approach mitigates duplication of effort, by working with and building off of existing relationships; this could include an amalgamation of individuals, institutions, or other communities of practice. The CBEP representatives emphasized that their broad objective is to fuse actively funded expertise and projects to better inform and drive global, regional, and national health security policies.

Following an introduction, the CBEP leads facilitated a conversation to build consensus on ways to organize and administrate the network through a Terms of Reference for Trusted Agents (TORFTA). A draft of the TORFTA was emailed to participants in advance of the meeting so the discussions were analytical and substantive. The meeting ended with notes for a new draft that participants agreed could be virtually edited via SharePoint.

The discussions regarding the TORFTA led to other discussions about the objectives for the network, which were revised in-real-time. The group agreed on the following objectives for the BPERN:

- Facilitate interdisciplinary relationships and collaboration to identify research goals and needs for bat-associated disease research and disease threat reduction;
- Unify CBEP regions to create a common action plan that yields collaborative and sustainable projects that achieve the following end states: (1) better informed policy-makers; (2) better informed scientific community regarding funding targets and gaps in areas of research and development; (3) better defined threat to global health security from bat-associated pathogens; and (4) improved national, regional, and global capacity to detect and respond to pathogens of security concern; and
- Enable better communication, coordination, and outreach at the research and conservation interface.

The meeting ended with a thorough discussion about the research focus areas for the group. The meeting participants self-nominated into Working Groups to serve as research mentors (note: a list of working groups and mentors is outlined under the Research Focus Areas section of this document). The group agreed that discussions about priorities within the Working Groups should occur at the next steering committee meeting.

The first meeting of the BPERN was a success. Participants readily took part in discussions and shared ideas from their respective multidisciplinary backgrounds. Many had experience forming similar research-based networks, and they appeared energized to solve global challenges related to spillover opportunity of bat-borne pathogens of security concern. While there were many unresolved topics of conversation (e.g., a new name for the network), the group agreed that they would communicate virtually on these subjects through email and SharePoint interaction, initiated by CBEP. They agreed to nominate and vote for individuals to serve as co-chairs of the Steering Committee as well as identifying an opportunity to

meet again within the calendar year (note: a full list of outlying issues and recommendations for action may be found in the Action Items section of this document).

RESEARCH FOCUS AREAS

WORKING GROUP 1: HOST / PATHOGEN BIOLOGY AND INTERACTIONS

- Bat physiology and immunology
- Bat pathogen community biology (co-infections, co-morbidities)
- Distribution of pathogens among species

WORKING GROUP 1 RESEARCH MENTORS

- Dr. Joram Buza, Nelson Mandela African Institute of Science and Technology, Tanzania
- Dr. Vivek Kapur, Penn State University, U.S.
- Dr. DeeAnn Reeder, Bucknell University, U.S.

WORKING GROUP 2: PATHOGEN SURVEILLANCE, DIAGNOSTIC CAPACITY, AND EPIDEMIOLOGY

- Molecular epidemiology
- Distribution of pathogens geographically and phylogenetically
- Detection, diagnosis, and reporting of bat-associated pathogens

WORKING GROUP 2 RESEARCH MENTORS

- Dr. Catalino Demetria, Research Institute for Tropical Medicine, Philippines
- Dr. Jon Epstein, EcoHealth Alliance, U.S.
- Dr. Tamar Kutateladze, National Center for Disease Control and Public Health, Georgia
- Dr. Lela Urushadze, National Center for Disease Control and Public Health, Georgia
- Dr. Supaporn Wacharapluesadee, WHO CC for Research and Training in Viral Zoonoses, King Chulalongkorn Memorial Hospital, Thailand
- Dr. Abel Wade, National Veterinary Laboratory, Cameroon

WORKING GROUP 3: ECOLOGY SETTING (BAT, DOMESTICATED ANIMALS, AND WILDLIFE INTERFACE)

- Bat behavior, distribution, and movement

- Domesticated animals and wildlife behavior, distribution, and movement impact on interaction with bats.
- The effect of anthropogenic disturbance and modification

WORKING GROUP 3 RESEARCH MENTORS

- Dr. Paul Cryan, United States Geological Survey (USGS) Fort Collins Science Center, U.S.
- Dr. Tigga Kingston, Texas Tech University, U.S.
- Dr. Robert Kityo, Makerere University, Uganda
- Dr. Rebekah Kading, Colorado State University, U.S.

WORKING GROUP 4: HUMAN-BAT INTERACTIONS, RISK CHARACTERIZATION

- Hunting and commodity chain (e.g., bushmeat, guano, and pet trade)
- Ecotourism
- Interactions in human dwellings

WORKING GROUP 4 RESEARCH MENTORS

- Dr. Kevin Olival, EcoHealth Alliance, U.S.
- Dr. Ian Mendenhall, Duke/NUS, Singapore

ACTION ITEMS

The following Action Items were recorded and compiled by the organizational and administrative support staff of CBEP / Executive Committee for the BPERN.

ACTION	APPROACH FOR COMPLETION WITH DATES	RESPONSIBLE AGENTS
Generate and send out options for new network name	(1) Send email to steering committee members soliciting options (with one week deadline) – 18 July (2) Preview options with Executive Committee – 25 July (3) Send all name options to group via polling application – 26 July	(1) Leahy (GSE) (2) Leahy (3) Leahy
Generate and send out solicitation for co-chair nominations	(4) Send request to steering committee members soliciting nominations (with one week deadline) in combination with the email from Task (1) (5) Preview options with EC – 25 July (6) Send all nominations to group for voting via polling application – 26 July	(4) Leahy (5) Leahy (6) Leahy
Generate and send out solicitation for next meeting conference opportunities and dates	(1) Send request to steering committee members soliciting nominations (with one week deadline) in combination with the email from Task (1) (2) Preview options with EC – 25 July (3) Send all nominations to group for voting via polling application – 26 July	(7) Leahy (8) Leahy (9) Leahy
Update TORFTA with recommendations from meeting	(4) Send invitation to steering committee members with editing options via APAN SharePoint – 19 July (5) Send Editing Form with above email – 19 July (6) Open editing period for one week – 19- 26 July (7) Collect comments and negotiate updates with EC 26-31 July	(10) Sander (CTR A&AS) (11) Sander (12) Sander (13) Sander / Leahy
Create CV Format for new members	(8) Create a CV Format (9) Upload to APAN	(14) Leahy (15) Sander
Finalize fact sheet	(10) Finalize fact sheet with updates from discussions (11) Send to PAO for review	(16) Leahy (17) Sander

ANNEX A – PARTICIPANTS

The following participants attended or were invited to attend the BPERN Kickoff Meeting in Fort Collins, Colorado on 29 June 2017.

STEERING COMMITTEE MEETING INVITEES, DID ATTEND		
Kityo	Robert	Makerere University, Uganda
Mendenhall	Ian	Duke-NUS, Singapore
Buza	Joram	Nelson Mandela African Institute of Science and Technology (NM-AIST) (attended virtually)
Kapur	Vivek	Penn State University (attended virtually)
Olival	Kevin	EcoHealth Alliance
Epstein	Jonathan	EcoHealth Alliance
Kading	Rebekah	Colorado State University
Urushadze	Lela	National Center for Disease Control and Public Health (NCDC) Georgia
Kutateladze	Tamar	National Center for Disease Control and Public Health (NCDC) Georgia
Wacharapluesadee	Supaporn	WHO CC for Research and Training in Viral Zoonoses, King Chulalongkorn Momorial Hospital, Thailand
Wade	Abel	National Veterinary Laboratory of Cameroon (LANAVET)
Demetria	Catalino	RITM, Philippines
Kingston	Tigga	Texas Tech University
Cryan	Paul	USGS Fort Colliins Science Center
Reeder	DeeAnn	Bucknell University
INVITEES, DID NOT ATTEND		
Smith	Gavin	Duke-NUS, Singapore
Alhmoud	Nesreen	Royal Scientific Society
CBEP AND CBEP CONTRACTOR INVITEES, DID ATTEND		
Lancaster	Mary	DTRA CBEP
Stokes	Marty	DTRA CBEP
Gamboa	Omar	DTRA CBEP
Sander	Will	CTR A&AS Booz Allen
Leahy	Katie	GSE
Devaney	Caitlin	GSE

ANNEX B – MEETING AGENDA

The following agenda was set for the meeting. The majority of discussions focused on administration, organization, and focus of the network. The group did not get to the topics to prioritize research gaps and set action plans with short and long-term milestones and deliverables. Event facilitators organized questions and prompts for those sessions, which they will use for the next BPERN meeting.

Time	Agenda Topic and Facilitator or Speaker	Expected Outcomes
0930 – 1000	**Welcome and Introductions**	
1000 – 1015	**Global Bat Alliance Overview** *Dr. Mary Lancaster (Africa Science Lead)* *Dr. Marty Stokes (SEA Science Lead, CBEP)*	• Review discussions leading up to this meeting • Discuss how this meeting is an opportunity to formalize the central / steering committee node for the distributed network • Emphasize that the steering committee shall focus on mentorship and connecting individuals and institutions across the globe
1015 – 1045	**Review Charter and Move to Agreement** *TBD*	• Vote to accept organizational document for steering committee • Unanimous (??) acceptance • We will advertise intent ahead of meeting • We will convene a meeting on 7 June to review and discuss the draft TORFTA
1045 – 1115	**Identify and discuss research focus areas** *TBD*	• Group will identify and discuss overarching focus areas and sub focus areas • Steering committee and invitees shall self nominate to groups and agree to serve as research mentors for the groups
1115 – 1230	**Breakout: Prioritize research needs and gaps** *TBD*	• Group will breakout into their research focus areas and begin identifying needs and gaps • Groups will then work to prioritize their lists
1230 – 1330	**Working Lunch** *TBD*	• Buffett • Convene back as a group, hold discussions about the overarching objectives of the alliance

		• Discuss One Health and Vector-based International meetings as an opportunity to re-convene semi-annually
1330 – 1400	**Breakout: Draft timelines and workplans** *TBD*	• Begin drafting short and long-term timelines and workplans for each focus area • Short-term milestones could include identifying key researchers and networks • Long-term milestones could include training events and focus area meetings
1400 – 1430	**Closing / review of actions** *TBD*	• Close-out meeting / 5min brief out for each group (2 slides) • Review action items and next steps

Bat-associated Pathogen and Ecology Research Network (BPERNet) Meeting
Pre-meeting Questionnaire

This BPERNet side meeting will bring together a multidisciplinary and One Health-focused group of scientists, policy makers, research scientists, and medical/veterinary practitioners with interests in bat-related research involving pathogens of security concern. The BPERNet identifies and shares information on research funding opportunities offered by multiple institutions. Most importantly, this network fosters international relationships among collaborators, agencies, and organizations, that can produce long-term, sustainable partnerships that withstand changes in government and organization budgets, priorities, postures, and policies.

We are working to define working group focus areas, identify resource needs and creating outreach plans. Ultimately, BPERNet will unify CBEP regions to create a common action plan that yields collaborative and sustainable projects. In order to accomplish our objectives, the following should be considered before our meeting on January 30th:

- **What are the "big" questions within your scope of research?**
- **How will you answer these "big" questions?**
- **What resources do you need to answer these questions?**
- **What are the end goals for your working group?**
- **What would be an indicator of success for your group?**
- **How would you measure your success?**
- **What are the limiting factors for achieving these goals?**
- **What risk or challenges do you foresee that would hinder your working group's success?**
- **Are there any common misunderstandings in your research community?**

ITTEE MEETING AGENDA

gen and Ecology Research Network (BPERNet)
0 January – 3 February 2018

Date: Tuesday, 30 January 2018

BPERNet

Time	Session	Notes
0830 - 0845	Introduction and Meeting Objectives	Marty Stokes and Mary Lancaster will welcome all participants and provide a brief overview of the meeting objectives for the week
0845 - 0900	Þ Review interim accomplishments since 27 June Þ Q&A on TORFTA changes Þ Call for votes to accept TORFTA	Executive Committee members will provide an overview of the TORFTA and mission areas; all participants will receive final version ahead of meeting
0900 - 1000	Working Group Focus Areas	Review WG focus areas that were outlined during the 27 June meeting Þ Review breakout group objectives and end goals Þ Review strategy map
1000 - 1015	Tea Break	
1015 - 1115	Breakout Group Session I	Breakout Group Session 1 Objectives: Þ Define WG research areas (sub-focus area definitions) Þ List and prioritize research questions and potential projects for each area Þ Identify internal and external research dependencies for each Working Group **Working Group 1: researching host / pathogen biology and interactions** (Dr. Deeann Reeder, Dr. Vivek Kapur, Dr. Joram Buza) **Working Group 2: researching pathogen surveillance, diagnostic capacity, and epidemiology** (Dr. Abel Wade, Dr. Jon Epstein, Dr. Catalino Demetria, Dr. Lela Urushadze, Dr. Supaporn Wacharapluesadee, Dr. Tamar Kutateladze)

		Working Group 3: researching ecology (bat, domesticated animal, and wildlife interface) (Dr. Paul Cryan, Dr. Tigga Kingston, Dr. Robert Kityo) **Working Group 4: researching human – bat interactions and risk characterization** (Dr. Kevin Olival, Dr. Ian Mendenhall)
1115 - 1200	Breakout Group Session I Brief-out	Each group briefs out their discussions according to the objectives; brief-out 10 minutes / WG; Q&A 5 minutes / WG
1200 – 1330	Working lunch / Open discussion	Open discussion objectives Þ Discuss group marketing campaign Þ Members should be prepared to introduce other network affiliations, conferences, and meeting opportunities to market the network, globally Þ Discuss long-term process to collect and collate applications to the network
1330 – 1430	Breakout Group Session II	Breakout Group Session 2 Objectives: Þ List out WG research coverage (who is researching what and where) Þ Identify research gaps and needs Þ Identify WG resource and coverage needs (e.g., target environmentalists in Europe); identify critical POCs for membership Þ Begin drafting short and long timelines and work plans
1430 – 1445	Tea Break	
1445 – 1545	Breakout Group Session II Brief-out	Each group briefs out their discussions according to the objectives; brief-out 10 minutes / WG; Q&A 5 minutes / WG
1545 – 1630	End of session	End of Session Objectives: Þ Review Strategy Map Þ Review Action Items Þ Discuss date, level of participation, and location for next meeting (all participants should come prepared to briefly discuss their ideas for this topic)

BPERNET

BAT-ASSOCIATED PATHOGEN AND ECOLOGY RESEARCH NETWORK

Version 1
September 2017

TERMS OF REFERENCE FOR TRUSTED AGENTS OF THE BAT-ASSOCIATED PATHOGEN AND ECOLOGY RESEARCH NETWORK (BPERNET)

1. BACKGROUND

In 2013, the Defense Threat Reduction Agency (DTRA) Cooperative Biological Engagement Program (CBEP) began leveraging, enhancing, and convening research networks to accelerate its programmatic and research driven targets and end states. CBEP uses this approach to connect its active funded research projects with other projects to help influence effective change for global health security; translating data into policy. Further, by using relationship-based research networks around the globe, made up of interdisciplinary relationships, This approach allows for novel and transformative scientific solutions for the world's largest infectious disease threats.

The Bat-associated Pathogen and Ecology Research Network (BPERNet) is a CBEP research network that connects multidisciplinary and One Health expertise to address challenges and threats posed by bat-associated pathogens of security concern. The BPERNet maintains the standards of all research networks that are supported by CBEP, in which members convene as a body of experts and researchers to: (1) share information, data, samples, and protocols; (2) coordinate research activities; (3) build training events and awareness-building workshops at all levels of decision-making authority; (4) develop community standards and best research practices; (5) create mentorship-based opportunities for students, trainees, and early-career researchers to convene, present, and share ideas; (6) establish a community of international research leaders and champions; (7) support and conduct responsible research, including communication to the public, which prioritizes bat conservation and welfare; and (8) reduce outbreak / transmission risk.

Some of the world's most deadly emerging zoonotic diseases are found in bats, including Nipah, Hendra, and Marburg viruses. There are a number of factors that make bats unique disease reservoirs, including their social behavior, distinct physiology and metabolism, ability to travel long distances, nocturnal activity, species diversity, and long life span (10-20 years, compared with a rat's average life of two years).[1] This combination of traits, coupled with the impact of human-mediated interactions and environmental changes, challenge researchers to understand the role of bats in global zoonotic disease ecology. This, a challenge is further complicated by the difficulty of bat husbandry in laboratory settings. The BPERNet creates opportunities for policy makers, researchers, conservationists, funders, and students to identify community challenges, develop priority research lists and associated action plans that target needs and gaps, and work at all levels to build awareness of bat-associated disease burden and transmission risks to improve the prevention, detection, diagnosis, and reporting of pathogens of security concern.[2]

2. BPERNET MISSION AND VISION

The BPERNet brings together a multidisciplinary and One Health-focused group of scientists, policy makers, research scientists, and medical/veterinary practitioners with interests in bat-related research involving pathogens of security concern. The network builds on community standards and best

[1] Hayman, David T.S., "As the bat flies," *Science* 02 Dec 2016: Vol. 354, Issue 6316, pp. 1099-1100 http://science.sciencemag.org/content/354/6316/1099

[2] Schountz, Tony, "Immunology of Bats and Their Viruses; Challenges and Opportunities," *Viruses,* 2014 Dec; 6(12): 4880-4901. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4276934/

practices for research. The BPERNet identifies and shares information on research funding opportunities offered by multiple institutions. Most importantly, this network fosters international relationships among collaborators, agencies, and organizations, which can produce long-term, sustainable partnerships that withstand changes in government and organization budgets, priorities, postures, and policies.

All members, or "Trusted Agents" of the Alliance play a role in operationalizing the objectives of the BPERNet, strengthening linkages and reducing overlap in global research on high-priority pathogens of bats (especially zoonoses) to maximize the efficient use of expertise and resources and accelerate the coordinated development of better disease surveillance and control methods.

3. OBJECTIVES

CBEP created a standard framework of objectives that it uses for its research networks, which is outlined in the Background Section of this document. The specific, research-focused objectives of the BPERNet are as follows:

- Facilitate interdisciplinary relationships and collaboration to identify research goals and needs for bat-associated disease research and disease threat reduction; and
- Unify CBEP regions to create a common action plan that yields collaborative and sustainable projects that achieve the following end states: (1) better informed policy-makers; (2) better informed scientific community regarding funding targets and gaps in areas of research and development; (3) better defined threat to global health security from bat-associated pathogens; and (4) improved national, regional, and global capacity to detect and respond to pathogens of security concern
- Enable better communication, coordination, and outreach at the research and conservation interface

4. APPROACH

The Terms of Reference for Trusted Agents (TORFTA) establishes ground rules and responsibilities for all members – known heretofore as "Trusted Agents" (TAs) of the BPERNet. The leadership structure of the BPERNet is made up of subject matter experts who serve as mentors and function as independent, trusted advisors and honest brokers for research within the BPERNet.

All TAs function within an organizational structure that consists of an Executive Committee (EC), a Steering Committee (SC), and four subject matter-focused Working Group (WG) subcommittees. The BPERNet employs a bottom-up design. This is an organizational approach that encourages ideas, solutions, and projects to start with TAs within the WGs. The ideas, solutions, and projects will filter through the WG mentors, who then link people, ideas, solutions, and projects together at the SC level; ultimately, this approach will (1) foster lasting relationships at an individual or institutional level, and (2) yield more data outcomes and/or fields of study. A visual representation of the responsibilities and organizational flow of the BPERNet is found in Figure 1.

Roles and responsibilities of the TAs within Committees and Working Groups are as follows:

4.1 Working Groups (WGs)

The WGs serve as subdivisions of the BPERNet designed to foster multinational and multidisciplinary participation and meet the wide spanning research challenges associated with bat-borne diseases. TAs from the SC serve as research mentors and subject matter experts within each WG, providing guidance on projects.

There are limited barriers to entry for becoming a TA in the BPERNet and joining a WG. Non-steering committee members should work or reside in CBEP engaged countries, which can be found in Annex B, and may be students, entry to mid-level career professionals, or anyone interested in contributing to the bat research community. Entry for individuals who do not work or reside in CBEP engaged countries will be considered by the EC on a case-by-case basis. Non-steering committee TAs do not have term limits, but are encouraged to collaborate, contribute, and participate evenly across the WGs. TAs receive invitation or nomination to participate in a WG by members of the EC or SC.

The WGs focus on the following research areas *(**note:** these focus areas were agreed upon at the BPERNet kickoff in Fort Collins, CO 29 June 2017*):

Working Group 1: Host / pathogen biology and interactions; specifically:

1. Bat physiology and immunology
2. Bat pathogen community ecology (co-infections, co-morbidities)
3. Distribution of pathogens among species

Working Group 2: Pathogen surveillance, diagnostic capacity, and epidemiology; specifically:

1. Molecular epidemiology
2. Distribution of pathogens geographically and phylogenetically
3. Detection, diagnosis, and reporting of bat-associated pathogens

Working Group 3: Ecology setting (bat, domesticated animals, and wildlife interface); specifically:

1. Bat behavior, distribution, and movement
2. Domesticated animals and wildlife behavior, distribution, and movement impact on interaction with bats.
3. The effect of anthropogenic disturbance and modification on pathogen dynamics and spillover risk

Working Group 4: Human-bat interactions; specifically:

1. Human behavioral risk characterization
2. Hunting and commodity chain (e.g., bushmeat, guano, and pet trade)
3. Ecotourism
4. Interactions in human dwellings

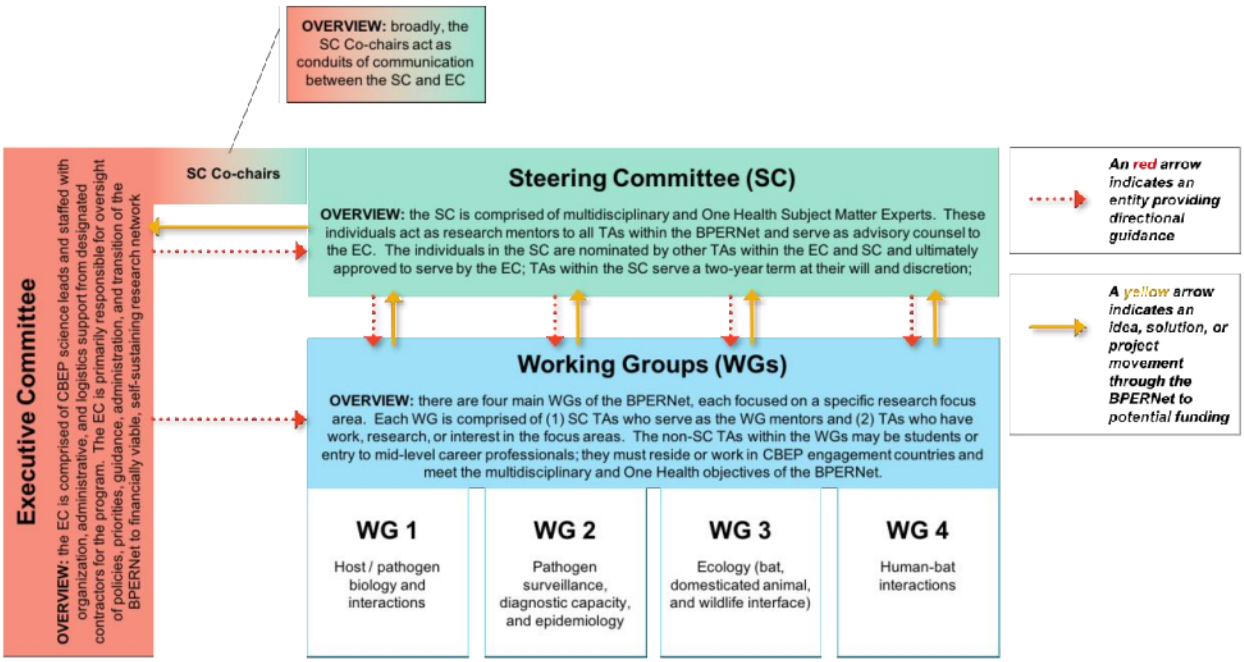
4.2 Steering Committee (SC)

The SC includes multidisciplinary subject matter experts. They fill two important roles to operationalize the objectives of the BPERNet, (1) acting as advisory counsel to the EC for global bat research (providing analysis of research gaps and needs and priority targets for future funds) and (2) serving as scientific mentors within WGs.

TAs within the SC advise on the scientific merit of proposals to the EC and assist with implementation per TORFTA guidance and EC direction. The selection process for SC membership gathers a multidisciplinary body of global representation, both geographically and across the bat research spectrum. Two SC Co-chairs are elected to serve as communication

between the SC and EC. Their roles and responsibilities are outlined in more detail later in this section.

TAs are nominated to join the SC by active members of the SC and EC. The inaugural SC was gathered together by the EC on 29 June 2017 in Fort Collins, Colorado. There is a two-year term limit for a TA in the SC, however, they have the option to leave and nominate a replacement at any time and with sufficient notification to the SC Co-chairs.



NOTE: *CBEP considers all contributors and participants of the BPERNet as "members" of the network; designating the term "Trusted Agents" (TAs) to all individuals regardless of role, affiliation, seniority, or responsibilities*

FIGURE 1 ORGANIZATIONAL STRUCTURE AND RESPONSIBILITIES OF THE BPERNET

The SC is responsible for the following items (at a minimum):

- Act as a scientific coordinating body for the BPERNet
- Consider and provide analysis on the scientific merit of proposals at the direction of the EC
- Serve as subject matter experts and research mentors for implementation of accepted BPERNet-endorsed projects
- Work within WGs to gather information on challenges, and propose research priorities to EC
- Identify possible conflicts of interest and make recommendations to SC Co-chairs and EC (e.g., one solution might be a temporary hiatus from the BPERNet or from service on the SC for a period of time)
- Annually review and make recommendations on policy and guidance of the BPERNet, which could include revision of the objectives, terms of reference, terms for membership, or structure of the BPERNet
- Work with the EC to determine challenges for transition to a self-sustaining network, which could include sources and means of political and financial support
- Define objectives, schedules, milestones, and deliverables of the WGs, as well as identifying need for proposing establishment of new or closing-out existing WGs

- Support WGs in organizing gap analyses and research prioritization
- Promote interactions between WGs
- Assess and report progress of the WGs to other members of the SC and EC
- Develop and encourage exchange of protocols and best practices, and agree on standard operating procedures, good research practice, and roadmap to reach BPERNet goals (short and long-term)
- Establish compliance rules for ethical practice, create training SOP

SC Co-chairs: Two members of the SC are chosen by majority voting during annual meeting of the EC and SC. All other TAs on the SC have two-year term limits; however, the Co-chairs hold one-year term limits, with the possibility of a one-year additional term upon re-nomination and approval from of the EC. These two individuals serve as the communication node between the EC and SC. They engage with the WG mentors that serve on the SC from the bottom-up, to identify candidates and projects. Other responsibilities include:

- Coordinate and communicate with EC organization and administration staff to arrange meeting schedule for EC/SC (virtual and in-person)
- Identify opportunities to broaden the network, e.g., conference attendance, paper presentations, etc.
- Communicate EC requirements to SC and set standards for good management practices within WGs
  - Reports
  - Schedules
  - Membership distribution
  - Information flow
- At the direction of the EC, act as a spokesperson for the network and interact with complimentary fields of study outside the network
- Work with the EC to determine and seek other funding opportunities
- Communicate regularly with EC on potential risks to self-sustainability of the network
- Advise the EC on potential conflicts of interest and recommended courses of action

4.3 Executive Committee (EC)

The EC ultimately sets policy and guidance for the BPERNet. It is chaired by the CBEP Science Leads from Africa and Southeast Asia and staffed with organization, administrative, and logistics support from designated contractors assigned to the program. The EC is primarily responsible for oversight of BPERNet governance policies and guidelines, which includes funding decisions, research priorities, adjudication of potential conflicts of interest, and BPERNet membership at all levels of participation. As such, the EC is the sole decision-making body of the research network for funding.

The EC is comprised of members from the CBEP Research Program, therefore, the details regarding program requirements and processes for funding can be found in Annex A of this document and should be used as a resource for all BPERNet Trusted Agents who wish to submit projects to CBEP. Any TAs considering application for projects will be governed by the terms for Conflict of Interest (in 5.2 under Governance and Membership) and are required to work with the EC, who will in-turn work with the TA to avoid any real or perceived individual or institutional conflicts of interest.

The EC and their team are broadly responsible for the following tasks (at a minimum):

- Review and approve objectives and goals for the BPERNet
- Review and approve Steering Committee and Working Group schedules and deliverables
- Provide organizational, administrative, and logistics support for meetings, conferences, and training events (virtual and in-person) of the BPERNet SC and WGs
- Work with Chairman and Deputy Chairman of the SC on marketing, communication, and outreach with other experts, fields of study, policy makers, international organizations, non-governmental organizations, and other networks
- Disseminate network information to all TAs, which could include newsletters, website links, press releases, and dates for upcoming meetings and conferences (inside and outside the network)
- Build connections with other funding agencies and organizations
- Convene a bi-annual research review for four focus areas of the network
- Measure network performance goals
- Score indicators of network transition to self-sustainability readiness

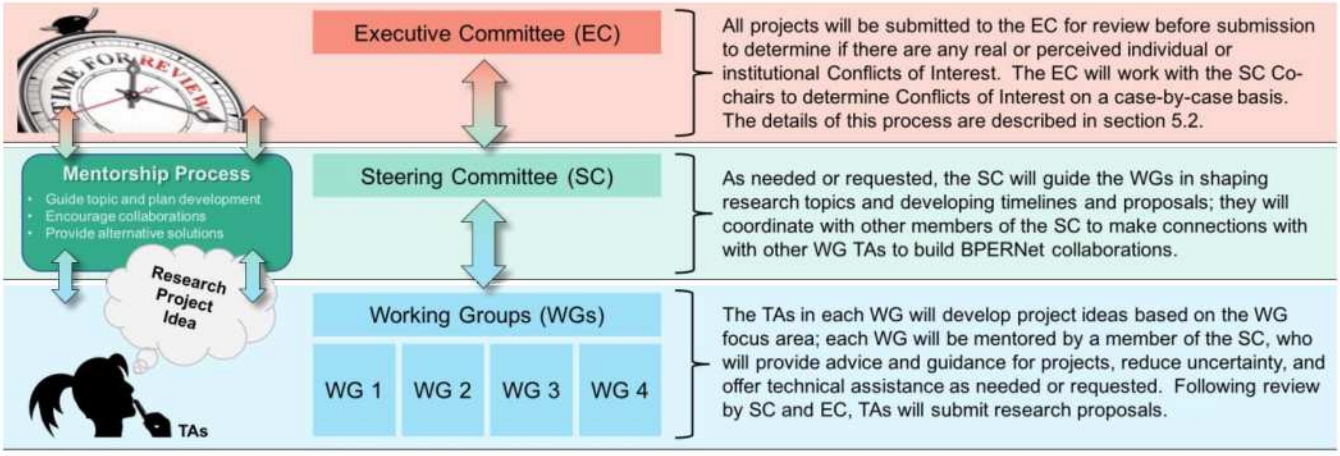


FIGURE 2 PROCESS FOR PROJECT DEVELOPMENT AND REVIEW

5. GOVERNANCE AND MEMBERSHIP

5.1 Accountability

The overarching duty of the BPERNet is to develop multi-disciplinary and multi-national, hypothesis driven, research projects and training opportunities that meet the prioritized challenges defined by the EC under advice from the SC with the goal of outlining community standards of practice. All TAs are accountable for the following:

- TAs must be familiar with the TORFTA and the mandate of the committees or WGs on which they serve
- TAs must promote a culture of responsible practice for scientific research
- TAs must work towards the short and long-term goals for the benefit of the BPERNet with a particular emphasis on the foci that fall within their WG
- TAs on the SC are selected for their breadth of experience, insight and knowledge, integrity and character, and sound and independent judgment; therefore, they are expected to bring

these personal qualities to their role on the SC and apply impartial judgment to help the EC make informed and independent decisions

5.2 Conflicts of Interest

The TORFTA document chooses the National Academy of Sciences (NAS) definition of Conflict of Interest: "a conflict of interest in research exists when the individual has interests in the outcome of the research that may lead to a personal advantage and that might therefore, in actuality or appearance compromise the integrity of the research."

No member of the Steering Committee may participate in a discussion where such participation would give rise to a potential conflict of interest. As defined in section 4.1, the EC shall review all situations and decisions insofar as a financial obligation is at stake. SC members may leave their term of service on the SC if they wish to participate in a funding opportunity that would otherwise be perceived as a conflict of interest. SC TAs must recuse themselves if any personal advantage, not just those of financial benefit, is perceived. Any member of the SC may discuss possible conflicts of interest with the EC before recusing themselves or stepping down from their term of service.

The EC arbitrates final decisions regarding potential conflicts of interest. With advice from the SC Co-chairs, they will determine if a recusal, resignation, or termination is required. The EC will determine the terms of recusal on a case-by-case basis, which could include being directed to abstain from any or all of the following: (1) meetings; (2) votes; (3) exchange of information; or (4) other correspondence. Ultimately, the EC advocates for complete transparency within the BPERNet, with an emphasis on early and frequent communication about any matter that could be perceived as a conflict of interest; this approach will mitigate ethics concerns and should eliminate the need for termination of service.

5.3 Selecting **TAs**

As stated in previous sections, all members of the BPERNet are referred to as "Trusted Agents" (TAs) of the network. TAs must reflect the One Health, multi-disciplinary, and multi-national nature of the BPERNet. There are no term limits for non-committee associated TAs, who are allowed to participate at will in accordance with terms of the TORFTA, additional selection rules are as follows:

5.3.1 ***Terms of service –*** *none*

5.3.2 ***Eligibility*** *– representation from each CBEP region must be maintained*

5.3.3 ***Nomination process –*** *nominated or invited to participate by the EC or SC at conferences, meetings, or electronically*

5.3.4 ***Selection process –*** *reviewed by members of the EC under advisement of the SC*

5.4 Selecting SC TAs

The SC includes TAs that are regarded as subject matter experts in their fields of research. TAs of the SC agree to the following rules for selection:

5.3.5 ***Terms of service –*** *2 years, no term limit*

5.3.6 ***Eligibility*** *– representation from each CBEP region must be maintained*

5.3.7 ***Nomination process –*** *nominated biennially by members of the SC (or more frequently as needed or requested by EC and SC Co-chairs); nomination process takes place in-person or virtually, selection is achieved through majority vote*

5.3.8 ***Selection process –*** *upon nomination by an SC member, potential applicant will submit an application consisting of a CV, letter of interest, and area(s) of interest related to the WG focus areas to the nominating SC member. The nominated applicant will be presented to the SC and EC by the nominating SC member. The applicant may be accepted as a SC TA upon majority vote by the SC and EC.*

5.5 Consensus

A quorum within the BPERNet is constituted by 2/3 approval within the SC, and rounded up when the number is uneven. The SC may decide by consensus or majority vote to ask other TAs to join a meeting to exchange information, material, or knowledge. The SC may establish sub-committees consisting of three or more of its members to conduct training or outreach (or any effort not explicitly within the stated focus areas of the SC and WGs). However, the Co-chairs should be informed of these efforts to communicate the need and seek approval from the EC

ANNEX A: APPLYING FOR FUNDING VIA EXECUTIVE COMMITTEE / CBEP

A.1 CBEP Research Scope

In order for CBEP to remain relevant, agile, and sustainable, research projects must be aimed at threat reduction objectives and demonstrate a clear nexus with the biosurveillance mission. The scope of CBEP research priorities include (but are not limited to):

- Understanding the ecology and epidemiology of pathogens of security concern, including HHS and USDA Biological Select Agents and Toxins and pathogens of pandemic potential, emerging, and re-emerging infectious diseases (e.g., avian influenza [low and highly pathogenic], African swine fever, Middle East Respiratory Syndrome (MERS), Ebola)
- Differentiating infectious diseases presenting clinical signs and symptoms similar to those of pathogens of security concern (e.g., influenza-like illness, acute febrile illness, fever of unknown origin)

CBEP will not support research projects that have no clear link to its threat reduction mission, are not sustainable for the partner country, or propose activities constituting Dual Use Research of Concern. These and other requirements and constraints are outlined in the figure below.

CBEP Fundamental Research Scope	
In Scope	Out of Scope

Projects that demonstrate:
• Clear relationships to pathogens of security concern
  ○ U.S. Biological Select Agents *
  ○ Pathogens of pandemic potential
  ○ Pathogens with potential to be weaponized
  ○ Emerging or re-emerging infectious diseases
  ○ Differentiating pathogens of security concern from agents with similar clinical signs and symptoms
• Links to threat reduction mission
• Support of BS&S and biosurveillance capabilities that reduce the threat of pathogens of security concern
  ○ Rapid, accurate, and safe detection, diagnoses, and reporting
• Alignment with both CBEP and partner country infectious disease priorities
• Use of sustainable techniques, procedures, and approaches in appropriate facilities
	Projects that focus on:
	• Dual-Use Research of Concern (DURC)
	• Diagnostic assay / novel technology
	• Development **
	• Medical countermeasures, including vaccine development
	• Non-infectious diseases
	
	Projects that contain:
	• Establishment of new pathogen repositories
	• No link to pathogens of security concern
	• No clear alignment to threat reduction mission
	• Use of unsustainable techniques, procedures, or inappropriate facilities
	  ○ Requires use of supplies or resources not available in country
	• No clear research question or hypothesis
	• No potential to generate knowledge that may result in scientific publications

* Pathogens on the HHS and USDA Biological Select Agent and Toxins List

** Field or country-specific validation of new diagnostic assays, novel technologies or equipment may be in scope if meeting other in-scope criteria

A.2 Applying for DTRA CBEP Research Funding

CBEP Research Objectives and Scope

DTRA CBEP is continuously seeking new collaborators, partners and international partners to conduct cooperative biological research to inform and enhance disease surveillance and global health security. Projects that are hypothesis-driven and contain substantive engagement with and contribution by partner country governments, institutions and scientists are appropriate for CBEP research funding. Research projects that support CBEP objectives in partner countries include those that promote One Health, improve disease surveillance, enhance understanding of endemic pathogens, explore the microbial ecology of endemic organisms, and enhance host country capabilities in support of World Health Organization International Health Regulations and World Organization for Animal Health reporting standards. Pathogens of interest include Biological Select Agents and Toxins, pathogens of pandemic potential, pathogens with the potential to be weaponized, emerging and re-emerging infectious diseases, and pathogens that are co-syndromic with associated select agent etiologies such as Influenza-Like Illness or Acute Febrile Illness. CBEP does not support research topics that involve Dual- Use Research of Concern or focus on disease agents that are sexually transmitted, non-infectious, or do not pose a threat to global health security.

Research projects supported by CBEP must align with CBEP's overarching goals to reduce the threat to U.S. and global health security and are expected to produce results suitable for scientific publication.

Applying to the Broad Agency Announcement (BAA) and Government Call

CBEP welcomes research funding applications from domestic and foreign academic, private, and government institutions, and has multiple solicitations available for proposals.

- Academic institutions, non-governmental organizations, industry, foreign laboratory equivalents, and members of the private sector must apply through Thrust Area 6: Cooperative Counter Weapons of Mass Destruction (CWMD) Research with Global Partners of the Fundamental Research to Counter Weapons of Mass Destruction (FRCWMD) – BAA (HDTRA1-14-24- FRCWMD-BAA).
- U.S. Government partners and Federally Funded Research and Development Centers (FFRDCs) must apply through Thrust Area 6 of the FRCWMD Government Call (HDTRA1-12-17- FRCWMD-Call).

All research ideas MUST be pre-coordinated through submission of an abstract to HDTRA1-FRCWMD-TA6@mail.mil prior to submitting a white paper. White papers (aka Phase I proposal) must be submitted and a full proposal (aka Phase 2 Proposal) invited prior to submission of a full proposal. Phase 1 and Phase 2 proposals to the FRCWMD-BAA must be submitted through www.grants.gov. Phase 1 and Phase 2 proposals to the FRCWMD-Call must be submitted through www.dtrasubmission.net. White papers and proposals will be peer reviewed in accordance with the evaluation criteria published in the BAA and Call and in coordination with appropriate CBEP Regional

and Country Managers. To be successful, a white paper and/or proposal must align with both the DTRA/SCC-WMD CBEP mission and regional priorities.

Detailed instructions for the FRCWMD-BAA and the FRCWMD-Call can be found through the solicitation links at www.dtrasubmission.net. Please ensure that you are downloading and reviewing the latest amended full announcement for the most accurate information and instructions. Offerors may submit questions of an administrative nature for BAA to HDTRA1-FRCWMD-A@mail.mil or for Service Call to HDTRA1-FRCWMD-C@mail.mil.

Subject: Quad Chart Request: BOHRN Vienna Workshop
Attachment(s): "BOHRN_QUADCHART[2].docx"

Dear BOHRN participants,

For our upcoming workshop in Vienna, we ask that you please fill in the attached quad chart. Each participant will be asked to present the attached quad chart during the workshop day 1 event (about five minutes per chart). The information presented will be used to aid breakout group and large group discussions. Directions on how to fill in the quad chart are outlined in the attached document on page 1 and a blank template is located on page 2.

If you and other participants are collaborating on the same research, you can submit one quad chart for the entire team. If you oversee funding applicable to this workshop, please let us know and we will send you additional information for this quad chart.

Along with the quad chart, we are requesting that you send a picture of yourself. The quad charts and pictures will be printed to display around the room during the two day workshop. If you are not able to attend the day 1 meeting, please still submit a quad chart.

Please send the attached quad chart and picture by Friday 26 October.

Kind Regards,

Megan

Megan Hudson
Task Lead | Global Systems Engineering
6303 Little River Turnpike #208
Alexandria, VA 22312

http://globalsyseng.com

Quad Chart Instructions: Please fill out all four portions of the quad chart. The chart is read in a clockwise direction starting with the technical description. This activity is intended to provide a big picture overview and not an in-depth report of your research. Please limit the text to provide only the most important aspects of each quad. You will be given 5 minutes to present the information within this chart. Refer to the questions in each box for more guided assistance.

TECHNICAL DESCRIPTION AND OBJECTIVES

Briefly describe the research you are currently conducting and why. What questions are you trying to answer and what is the importance of this research to your field and the region? What are the specific aims of your research? What is currently known about your research? Consider the following:

1. **Objectives of research**
2. **Current state of understanding**
3. **Location of research (city/country and or coordinates)**

KEY PARTNERS AND REGIONS OF STUDY

Briefly describe the key partners and funders in your research. List the region(s) your research is being conducted in and any networks you are working with formally or informally. Consider the following:

1. **Who are the key partners involved in your research?**
2. **Who are the key funders involved in your research?**
3. **What region(s) is your research being conducted in?**
4. **Are you working with any networks (formally or informally)?**

MILESTONES, STATUS, AND CHALLENGES

Briefly explain the timeline of your research. When do you anticipate your research to be completed? Are there deliverables or steps along the way that will show substantial progress? Identify the challenges you will face. Consider the following:

1. **Provide timeline for delivery**
2. **Overview on project status**
3. **List challenges or needs in your research**

REGIONAL IMPACT

Describe the potential regional impact of your research. What will the impact be for the regional area? Will this lead to the need for future studies? Consider the following:

1. **Define the quantitative impact of project.**
2. **Define the regional impact.**

TECHNICAL DESCRIPTION AND OBJECTIVES

Dear Marty
Thanks for the speedy response and support! Great to hear of the documentation efforts and continued commitment.

The lynchpin to everything that we'd like to do is the BOHRN website – is there a webmaster, or can one be allocated, so that we can host content, build membership, post some of the materials that have been developed.

Best

Subject: RE: BOHRN Status, publication

Hi Tigga,

Congratulations on having your piece accepted (with revisions, as always)! I would really appreciate you adding detail about BOHRN and highlighting the network's efforts. All of the positive outcomes you mention are well noted and align with our goals and objectives, which remain steadfast.

The current situation has certainly created unexpected challenges for all our work, but we're adapting, and want to ensure that we continue moving forward and position the network to pick up where it left off last summer, once things return to a more normal environment. In the meantime, we'll do what we are able virtually.

Let us know what you need to support this. Katie and I, along with our teams, recently updated a huge amount of documentation, reports, participant lists, etc. for BOHRN and other our TRNs for the incoming BTRP Director, in order to deposit it on our internal database, so it should be very easy to provide whatever you need. Just let us know how we can help.

Thanks so much!

Best,
Marty

Subject: [External Sender] BOHRN Status, publication

Dear Marty,

Rebekah Kading and I wrote a perspectives piece that is in revision for PLOS Biology. It calls for greater integration of ecologists/virologists (hmm, sounds familiar) and builds on analysis of a publication coauthor network. We conceptualized this at BORHN meetings and consider it a true BOHRN output, supporting BOHRN's message.

One of the reviewers specified some simple, but concrete actions that they would like to see in the revision. These actions closely ally with things we've begun at BOHRN (e.g., mission statement, contact lists of researchers). We would really like to be able to respond using BOHRN's infrastructure as it would be a good fit and would draw substantial attention to BOHRN and help boost the distributed membership and get us more on the map. The reviewer called for a mission statement, a list of who is doing what, and other simple things that could easily be integrated into the BOHRN website.

Currently, we refer to BOHRN in the acknowledgements, but have been reluctant to feature the network too centrally because we are unsure of its status and stability. It would be great to move forward with BOHRN featured more prominently, but we could do with some clarity of where things are heading. At minimum we need support of the website as that is where we will be directing people. Currently people can't join, or reset passwords etc, and we would need to work with someone on updates supporting these simple collations of information.

We have a bit less than a month to turn this around and get our revision in, so it would be great to hear your thoughts. I hope we can talk soon. I am now free fairly consistently between 10 am-Noon Mo-Thursday. I have other windows here and there as well.

All the best

Tigga

Just wanted to send a quick update on our paper…. I'm honestly surprised at how long PLOS Pathogens is taking, but I guess the editorial process slowed down w COVID.

We send in edits on pre-proofs a couple of times over the last few weeks, and have been waiting for over a week for the typeset proofs to come in. Once those come back and we have a publication date, I'll let you all know ASAP.

Cheers,
Kevin

Dear Dr. Olival,

We are pleased to inform you that your manuscript 'Title - Possibility for reverse zoonotic transmission of SARS-CoV-2 to free-ranging wildlife: a case study of bats

Short Title - Possibility for SARS-CoV-2 transmission from humans to free-ranging bats' has been provisionally accepted for publication in PLOS Pathogens.

Before your manuscript can be formally accepted you will need to complete some formatting changes, which you will receive in a follow up email. A member of our team will be in touch with a set of requests.

Please note that your manuscript will not be scheduled for publication until you have made the required changes, so a swift response is appreciated.

IMPORTANT: The editorial review process is now complete. PLOS will only permit corrections to spelling, formatting or significant scientific errors from this point onwards. Requests for major changes, or any which affect the scientific understanding of your work, will cause delays to the publication date of your manuscript.

Should you, your institution's press office or the journal office choose to press release your paper, you will automatically be opted out of early publication. We ask that you

notify us now if you or your institution is planning to press release the article. All press must be co-ordinated with PLOS.

Thank you again for supporting Open Access publishing; we are looking forward to publishing your work in PLOS Pathogens.

Dear Megan and others,

Unfortunately the BOHRN meeting dates coincide with a field demonstration and contract signing for a new research project I'm starting here in Colorado. Despite my best efforts to reschedule, I don't think I'm going to be able to make it. Regardless, please keep me in the loop and I'll do my best to participate remotely if there are options to do so.

All the best,
Paul

Hi Kevin,

Very nice job on this! Only spotted a couple small things.
1) "highlights" is misspelled on line 128.
2) looks like a ref is still needed in line 342 regarding PPE usage in the field. This ref might fit...it's more broadly on wildlife professionals though (PMID: 31993824)
3) don't forget to delete the [...] on line 421

Yes, I would be delighted to be a co-author.

My ORCID is 0000-0002-4996-915X.

Thanks so much!

Subject: Final version of North American bat/SARS2 ms - PLEASE REVIEW

Dear Esteemed Colleagues,

Please review the attached penultimate draft of our manuscript (now entitled: **"Possible risks of SARS-CoV-2 spillover to free-ranging wildlife: a case study of bats")**, together with the supplementary table and refs. Our plan is to submit to *Lancet Infectious Diseases* as a review article (correct length and they allow 150 refs) in the next week - references are currently formatted for that journal. We would also like to post it on bioRxiv as a pre-print once we get it submitted to *Lancet ID*. Please let me know if you have any concerns with that plan.

Thank you all for your excellent comments and edits on the previous draft. Paul and I have gone back and forth on several rounds of revisions since then (and multiple late night texts), aiming to take each and every suggestion into account, and we believe it's a much better manuscript now! Very excited about this one, and looking forward to getting it published!

By Thursday April 30th (or ASAP), could you each please:

1. Confirm that you agree to be a co-author.
2. Double check your name and affiliation, and send me your ORCID number if you have one.
3. Read through the ms and send any important, last minute changes or edits you feel are necessary. Please use track changes. If you're okay with the ms as is, please just confirm so.
4. For my Federal US Gov't friends (USFWS, USGS, CDC, USDA) - please let us know what we need to do for approval on your end. I know Paul is working with USGS now to hopefully get rapid clearance.

No need to cc all if you don't want, but please include both me and Paul on your response.

Looking forward to hearing from you all soon!

Cheers,

Hi Kevin,

Very nice job on this! Only spotted a couple small things.
1) "highlights" is misspelled on line 128.
2) looks like a ref is still needed in line 342 regarding PPE usage in the field. This ref might fit...it's more broadly on wildlife professionals though (PMID: 31993824)
3) don't forget to delete the [...] on line 421

Yes, I would be delighted to be a co-author.

My ORCID is 0000-0002-4996-915X.

Thanks so much!

Hi Paul
Very interested to see the MS. Rebekah and I have been working on something that arose out of BOHRN that would be very complementary and might be worth trying to coordinate dissemination in some way. We are meeting today and will take stock of where we are at.

I just started an email to you and Kevin about the state of affairs as we Rodrigo and I are getting quite a bit of push-back on the IUCN BSG recommendation to suspend field studies while further data are gathered (primarily from western scientists with access to PPE). It would be good to hear what those committees are finding sooner rather than later.

Best wishes

Tigga

Subject: SARS-CoV-2 spillback risk to North American bats

Hi Tigga,

Sorry for the silence since my call for help about the risks of humans potentially infecting bats in North America with the SARS-CoV-2 virus. Thanks for your patience and willingness to get involved in what we're hoping can be another disease response where scientists coming at disparate aspects of bats and pathogens can help each other. Those of us in the bat research world that focused most of our past efforts in the U.S. on conservation and management of bat populations can certainly use your expertise and help adjusting to the new situation.

A lot happened during my silence. Another group in USGS has been working at the behest of decision makers across federal and state natural resource management agencies to pull off a formal risk assessment by querying a subset of the experts we've reached out to. You lucked out and were not chosen for that exercise (yet), but we will keep you posted on the outcomes of that rapid assessment.

The other thing keeping me silent over the past couple of weeks is a short manuscript (currently 5 pages single spaced) that Kevin Olival and I drafted to articulate the potential risks of humans infecting North American temperate-zone bats with SARS-CoV-2, potentially relevant patterns we observed in bat-CoV distributions at a global scale, and the likely benefits of disease and bat researchers working together to draw on the strengths of our various disciplines. We hope to have a draft to circulate by tomorrow and would appreciate input and feedback from any of you willing to read it and help us stress test the concepts and assertions therein. Please let me know if you are interested.

Thanks again for your help and patience.

All the best,
Paul

Subject: Re: [EXTERNAL] Re: SARS-CoV-2 spillback risk to North American bats

Hi Rebekah and Tigga,

Thanks for the awesome and quick improvements to the manuscript. I'm assuming you're okay with being co-authors, cause you are now. ☺

I'm working through the comments from everyone now and will get back to you with thoughts about the more strategic and substantive ideas after I've had some time to think about them and catch up with myself.

In the meantime, one easy answer is that I see I created some confusion by citing Tao and Tong for Nyctalus leisleri and Hipposideros pratti in the supplemental table, which were actually reported by Drexler et al. 2010 (attached)...oops, good catch! I'll add country of origin to that table and flesh out the cross-referencing a little better for the next iteration.

And Tigga, thanks for those taxonomy updates! I didn't know about those changes, so thanks for that. DeeAnn is also looking at this and said she'd send a new table of the African pteropodid names, so I'm learning a lot.

Stay tuned and thanks again,
Paul

Cc: ecohealthalliance.org
Subject: RE: [EXTERNAL] Re: SARS-CoV-2 spillback risk to North American bats

P.S. I looked at the table, and also spotted some things to check in addition to those high-lighted by Rebekah. Perhaps “Region” needs some clarification if it is where the bat was sampled – in the cases below it isn’t very representative of the distribution or was impossible

- *Rhinolophus ferrumequinum* is a Eurasian species, just tips into N. Africa
- https://en.wikipedia.org/wiki/Greater_horseshoe_bat

R. sinicus – predominantly Chinese bat -- doesn’t get in to Africa
https://en.wikipedia.org/wiki/Chinese_rufous_horseshoe_bat

Taxonomic updates:

FYI *Pteropus giganteus* is no more, it is currently recognized as *P. medius*

Eonycteris spalaea – spelling sp**e**laea

Note that the Hipposiderids have been broken with Rhinonycteridae elevated to family…

family **Rhinonycteridae**. elevated by Foley, *et al*, 2014.[2]
- genus *Cloeotis*
- genus *Brevipalatus*
- genus *Brachipposideros*
- genus *Paratriaenops*
- genus *Rhinonicteris* J.E. Gray, 1847
- genus *Triaenops*

So you might want to update the relevant species.

Best
Tigga

Subject: RE: [EXTERNAL] Re: SARS-CoV-2 spillback risk to North American bats

Hi Paul and Kevin

Great job, as Rebekah said.

I thought I'd give holistic feedback of possible gaps, inevitably based on commenting on the influence of ecology or at least species variability in possible risk. Despite the fact that you mention there are 40+ species at the beginning, this gets a bit lost and so we end up of perceiving "north American bats" as a single species. This is a trend that I've seen elsewhere in disease papers, in fact I read a risk perception paper recently that managed to get although way through without identifying a single species. It is relevant because, as we've seen with WNS, species have exhibited different responses and we could anticipate different spillback and transmission probabilities among species. This may be a function of differences in species-specific physiology but critically aspects of ecology (especially sociality/roosting ecology) and human-bat interface. So perhaps in the paragraph about interdisciplinary research you could highlight the diversity of bats and their ecology (not just numbers) and the consequences for interspecific differences in risk. (for eg. do you think Lasiurines are as at risk as Myotis?). The implications are essentially that there will never be a simple model system, and we must be very wary of extrapolating from single-species studies, but perhaps current knowledge of bat ecology in N Am (a pretty well known fauna compared to some parts of the world) in combination with virological, genomic and disease ecology expertise could be used to prioritize research.

This leads into whether there could be more strategic research recommendations to close out with. I like the suggestions in the final paragraph on how to implement research and useful contributions that could be made in the study of "north american bats". Closing out with possible priorities or a suggested strategy would make the document even more useful. For example, ensuring surveillance/discovery of the more synanthropic species, colonial species, or species already compromised by WNS, surveil widely across the N. Am phylogeny. Are there particular regions or contexts of N. America that should be the focus of efforts (species-rich caves, peri-urban and urban settings, species-rich geographic areas?). If that all seems too much to be definitive on, perhaps calling for cooperative development of a strategy with these as some suggested areas for consideration could be the way to go.

I think some consideration of the above would improve the MS and position it better in the research community as a springboard for more cohesive collaborative work. You want to guard against "we need more surveillance so give us funding" criticisms. Happy to help on that although my knowledge of N. Am bats is limited as you know, but could work on something about priority setting if you wish.

Minor point.. the SEABCRU link – that goes with the sentence below is actually a good example of how PPE guidance can be developed for ecologists/field researchers. It was based on a decision tree that reflects different contexts, and hence risks, that field biologists might find themselves. (great job Kevin…..) So it better illustrates that this can be done.

Hope this helps
Tigga

Cc: ecohealthalliance.org
Subject: Re: [EXTERNAL] Re: SARS-CoV-2 spillback risk to North American bats

Hi everyone -

Kevin and Paul - this manuscript is very good - thank you for putting it together!! I'll follow up later today with a few comments on the text. I want to read it again but have to go take care of our mosquito colonies at the moment...the one essential duty we have ongoing! I'm attaching the table in the meantime...very comprehensive, wow! I thought it might be helpful for readers to have a column with the broad geographic region of the coronavirus detection in each of the bats, so I added a column to cover this. In instances where the range of the bat species was fairly extensive, I went with where the sampling occurred in the paper. See if you like it...no worries if you don't think its necessary. A couple details/questions came up while I was working on that though:

- excel line 13 - *Nyctalus leisleri* is a European species but Tao and Tong sampled in Kenya...did they mis-identify or maybe there's an accidental reference error?
- excel line 22 - *Hipposideros pratti* looks like an Asian species but the Tao and Tong reference just sampled from Kenya
- excel line 49 - I changed this to Yinterochiroptera and colored it yellow

Question: Is it worth denoting on the table somehow where there is evidence of cross-species sharing of coronavirus strains? For example lines 44-45 the notes have "Eidolon_CoV" but the virus detections being reported were from *Scotophilus* and *Triaenops*...my interpretation is that the virus detected from those latter two bats was the same strain as was detected in *Eidolon* previously? Is there enough evidence to say anything about viral sharing (i.e. are full genomes available) or do we just leave that go for now? I was just thinking that it might be worthwhile to point out any propensity for transfer of strains between/among bat species because that would have relevance to NA bats too.

More later - thanks again - this is a very nice paper and impressive you put it together so quickly!

Hi Rebekah and Tigga,

Without further adieu, I'm attaching the manuscript draft that Kevin and I put together over the past week and would very much like your input on. Its much leaner and meaner than the rambling draft that went out to the decision-making group last week.

Please take a look if you have the time and consider joining us in trying to get it published somewhere fairly high profile in the coming weeks.

All the best,
Paul

Question: Is it worth denoting on the table somehow where there is evidence of cross-species sharing of coronavirus strains? For example lines 44-45 the notes have "Eidolon_CoV" but the virus detections being reported were from *Scotophilus* and *Triaenops*...my interpretation is that the virus detected from those latter two bats was the same strain as was detected in *Eidolon* previously? Is there enough evidence to say anything about viral sharing (i.e. are full genomes available) or do we just leave that go for now? I was just thinking that it might be worthwhile to point out any propensity for transfer of strains between/among bat species because that would have relevance to NA bats too.

More later - thanks again - this is a very nice paper and impressive you put it together so quickly!

Hi Rebekah and Tigga,

Without further adieu, I'm attaching the manuscript draft that Kevin and I put together over the past week and would very much like your input on. Its much leaner and meaner than the rambling draft that went out to the decision-making group last week.

Please take a look if you have the time and consider joining us in trying to get it published somewhere fairly high profile in the coming weeks.

All the best,
Paul

Hi Paul, Kevin, Tigga,

I'll just reply to this thread. Yes, I'd be happy to take a look at the paper as well -- thank you very much for spearheading that effort! As Tigga mentioned we're working on something as well that we'll reach out to you guys separately about. Seems like BOHRN is mobilizing on multiple fronts, which is great to see.

Take care and talk to you soon -
Rebekah

Hi Paul
Very interested to see the MS. Rebekah and I have been working on something that arose out of BOHRN that would be very complementary and might be worth trying to coordinate dissemination in some way. We are meeting today and will take stock of where we are at.

I just started an email to you and Kevin about the state of affairs as we Rodrigo and I are getting quite a bit of push-back on the IUCN BSG recommendation to suspend field studies while further data are gathered (primarily from western scientists with access to PPE). It would be good to hear what those committees are finding sooner rather than later.

Best wishes
Tigga

Subject: SARS-CoV-2 spillback risk to North American bats

Hi Tigga,

Sorry for the silence since my call for help about the risks of humans potentially infecting bats in North America with the SARS-CoV-2 virus. Thanks for your patience and willingness to get involved in what we're hoping can be another disease response where scientists coming at disparate aspects of bats and pathogens can help each other. Those of us in the bat research world that focused most of our past efforts in the U.S. on conservation and management of bat populations can certainly use your expertise and help adjusting to the new situation.

A lot happened during my silence. Another group in USGS has been working at the behest of decision makers across federal and state natural resource management agencies to pull off a formal risk assessment by querying a subset of the experts we've reached out to. You lucked out and were not chosen for that exercise (yet), but we will keep you posted on

the outcomes of that rapid assessment.

The other thing keeping me silent over the past couple of weeks is a short manuscript (currently 5 pages single spaced) that Kevin Olival and I drafted to articulate the potential risks of humans infecting North American temperate-zone bats with SARS-CoV-2, potentially relevant patterns we observed in bat-CoV distributions at a global scale, and the likely benefits of disease and bat researchers working together to draw on the strengths of our various disciplines. We hope to have a draft to circulate by tomorrow and would appreciate input and feedback from any of you willing to read it and help us stress test the concepts and assertions therein. Please let me know if you are interested.

Thanks again for your help and patience.

All the best,
Paul

Is there a risk of SARS-CoV-2 infection and transmission in North American bats?

Kevin J. Olival, Paul M. Cryan*, Kevin T. Castle, and multiple invited co-authors…*

*These authors contributed equally

Spillover and "spillback" of pandemic viruses

The threat of emerging infectious diseases (EIDs) to wildlife populations and biodiversity conservation is recognized (*1*), but cross-species transmission of novel pathogens, or spillover, is typically viewed in the narrow context of originating *from* a wildlife reservoir and transmitting *to* humans. Research assessing EID risk has focused on identifying geographic regions (*2, 3*) and wildlife species (*4-6*) where spillover of zoonotic diseases into human populations is most likely. Among recent pandemic viruses of zoonotic origin, some have no evidence of "spillback" to wildlife or domestic animal populations after they were established in people (e.g., HIV, which causes AIDS), and others cross species boundaries with fluidity (e.g. pandemic H1N1 Influenza A virus (*7, 8*)). Evidence of spillback, or reverse zoonosis, into wildlife and domestic animals is widespread (*9*), but viral spillback to wild bats has not been recorded. In December 2019, a novel coronavirus (now SARS-CoV-2) infected a cluster of humans in Wuhan, China and has since spread to become a global pandemic. The virus has reached over 185 countries, infected >2.1 M people, and killed >147,000. Phylogenetic evidence suggests that SARS-CoV-2, along with the entire clade of SARS-related coronaviruses (SARSr-CoVs), are zoonotic and evolved in Old-World bats from the family *Rhinolophidae* (*10-13*). The closest known virus to SARS-CoV-2 was discovered in *Rhinolophus affinis* from Yunnan province in China with 96% sequence similarity across the virus' genome (*14*), yet which proximate species led to human spillover remains unclear (*15*). The United States (US) is currently the epicenter of the largest recognized outbreak of COVID-19, with community transmission in all 50 states. The unintended consequences of this pandemic are many and include the possibility of SARS-CoV-2 spillback to free-ranging wildlife populations. Here we assess the possibility of SARS-CoV-2 spillback from humans to North American (NA) bats and discuss possible consequences of the virus becoming endemic in bats outside its natural host range.

The triple threat of SARS-CoV-2 to North American bats

The pandemic human spread of SARS-CoV-2 may threaten NA bat populations in three different ways. First, SARS-CoV-2 might infect and cause disease among the diverse and historically isolated 40+ species of temperate-zone NA bats. Second, SARS-CoV-2 might be able to infect and become established in one or more of these NA species, creating a diverse new suite of temperate-zone wildlife disease reservoirs. Third, if SARS-CoV-2 can persistently infect one or more species of NA bats, it could potentially evolve, or recombine with other endemic viruses, to become more pathogenic to humans and other mammals. The latter outcomes would undoubtedly shift public perception of bats from mostly beneficial wildlife with manageable associated disease risks, to bats as harmful nuisance animals posing unacceptable disease risks to human health. In addition to new public health challenges, such shifts could undermine decades of concerted science, conservation, and education efforts aimed at these important animals.

Lessons from an epizootic -- susceptibility of North American bats to introduced pathogens

SARS-CoV-2 is not the first pathogen that humans could inadvertently spread to NA bats. The COVID-19 pandemic follows the arrival of a fungal pathogen (*Pseudogymnoascus destructans*) that in 2007 began infecting NA populations, crossing species barriers, spreading among, and altering the evolutionary trajectory of the continent's bats (*16-19*). The disease of hibernating bats caused by that fungus, White-Nose Syndrome (WNS), remains the first and only documented bat epizootic (*20, 21*). WNS has killed millions of NA bats, affected populations of at least 12 species of 3 genera, and has already spread across half of the United States (US) and Canada. Methods of mitigating WNS spread and impacts remain elusive. It took years of concerted international scientific effort to first identify the novel cold-growing fungus, determine that it probably originated somewhere in the temperate zones of Europe or Asia, understand its mechanisms of infection and pathogenicity, and to track its rapid spread through an immunologically naïve continental assemblage of hibernating bats that lacked many defenses against it (*22*). The devastating impact of WNS on a diverse group of NA bats likely resulted from evolutionary isolation of the continent's bat fauna from large parts of the world for millions of years. Bats in both Europe and Asia can become infected by *P. destructans*, but do not suffer mass mortality from WNS (*23, 24*). No extant species of bat that occurs in the Americas also occurs outside of the Americas (*25, 26*), and no bat species regularly migrates or likely survives flights across the Pacific or Atlantic oceans (*27, 28*). The bat fauna spanning the higher latitudes of NA (e.g., US and Canada) is composed almost entirely of species belonging to the world's largest bat family -- Vespertilionidae. Vespertilionid bats occur all over the world, but likely originated and diversified in NA tens of millions of years ago -- they are the only bat family to increase in diversity northward out of the tropics and consistently reach high latitudes (50ºN;(*29, 30*). The WNS epizootic taught us that a large proportion of this historically isolated bat fauna can be vulnerable to pathogens introduced from other continents. The COVID-19 pandemic invokes the specter of WNS and highlights deficits in our understanding of pathogens in NA bats.

Gaps in understanding global patterns of bat-CoV diversity and evolution

Bats are among the most diverse mammals (approximately 1,400 species), and global distributions and diversity of CoVs in bats proportionally reflects that of their hosts (*31, 32*). Bats also rank among the most ecologically important but underappreciated mammals that play varied roles in most of Earth's ecosystems (*33, 34*). Coronaviruses appear to have ancient and ancestral relationships with bats, diversifying globally through a process of within-host evolution and cross-taxonomic host-switching events (*31, 35, 36*). Available evidence indicates that bats are natural reservoirs of CoVs with pre-emergent potential to cause diseases in humans, livestock, and other types of domestic animals and wildlife (*14, 31, 37-50*). Indeed, bats are the likely progenitor hosts of all alpha (α-) and beta (β-) CoVs (*51*) and potentially all *Coronaviridae* (*52-57*). Two recent human disease epidemics (Severe Acute Respiratory Syndrome [SARS], Middle East Respiratory Syndrome [MERS]) and now the COVID-19 pandemic were caused by viruses that probably originated from CoVs circulating in populations of wild bats near the outbreak origins (*14, 38-43, 49, 50, 58, 59*). A similar CoV of likely bat origin also recently

caused Swine Acute Diarrheal Syndrome (SADS) outbreaks and mass mortality of piglets on farms in Guangdong province, China (*46*). Emergence of diseases like SARS, SADS, and now COVID-19 from the same general region strongly indicates a close association between CoVs likely to evolve into pathogens and the wildlife reservoirs where they originate (*14, 38-43*). Bat CoVs show clear global patterns of geographic structure that reflect host distributions, and typically strong co-evolutionary patterns among related hosts (*31, 49, 60, 61*). These phylogeographic factors are also universal determinates of viral sharing among all mammals (*62*). However, predicting broad CoVs jumps (i.e., that lead to spillover and spillback) is difficult because of the wide potential host breadth for many CoVs (*13, 44, 45, 63-67*), and the fact that bats are often asymptomatic reservoirs capable of harboring a diversity of CoV lineages -- obscuring bat-virus association patterns (*31, 49, 50, 61, 68*). Bat-CoV associations remain woefully understudied in temperate-zone NA, despite the large number of bat biologists and virologist working in the US, Mexico, and Canada (*31, 68-70*).

Are viruses like SARS-CoV-2 already widespread in North American bats?

Our preliminary examination of CoV evolutionary lineages and global distribution patterns of the diverse bats they infect suggests that NA bats could be immunologically naïve to infection by viruses like SARS-CoV-2. Alpha and β-CoVs have been detected in bats on most continents, sometimes with both types occurring in the same bat species and individuals (*49, 50, 71*). However, a striking exception to this pattern is the apparent lack of evidence that β-CoVs infect bats of temperate-zone NA. Multiple novel α-CoVs have been detected and described in Nearctic vespertilionid bats of the US and Canada, infecting species living in close contact with humans and in remote wild areas (*68, 70, 72*). Alpha-CoVs of likely bat origin can cause disease in humans and other animals including human α-CoVs NL63 and 229E (*73, 74*). However, emerging infectious diseases like MERS, SARS, SADS, and COVID-19 are caused by β-CoVs. Therefore, scientists have focused great effort on detecting, genotyping, studying the geographic distribution, and host-cell receptor binding of β-CoVs in bats (*49, 50*). SARSr-CoVs of the viral subgenus *Sarbecovirus* that can bind to angiotensin-converting enzyme 2 (ACE2) host-cell receptors of humans and other animals have thus far been detected mostly in species of the Old-World Chiropteran suborder Yinpterochiroptera (Table S1; Fig. 1A; (*11, 31, 49, 50, 75-79*). Two exceptions to this pattern were detection of novel Clade 3 and Clade 1 *Sarbecovirus* (*sensu* (*41*)) in the bat *Chaerephon plicata* (family Molossidae) in China (*80*) and the vespertilionid species *Nyctalus leisleri* cohabiting a Bulgarian cave during autumn with several species of *Rhinolophus* in which other SARS-related β-CoVs were concurrently detected (Fig. 1A; (*81*). β-CoVs of other distinct evolutionary lineages, such as viral subgenera *Hibecovirus* and *Nobecovirus*, also tend to occur mostly in Old-World bat families, with the exception of novel viruses of the latter subgenus detected in two species of *Scotophilus* in Africa (Fig 1B, C; (*31, 41, 49, 50, 77, 82*). Bat β-CoVs of the subgenus *Merbecovirus* (MERS-related lineage) occur in a greater diversity of bat families and across more global regions than others (Fig. 1D; (*49, 60*). These widely distributed viruses can evolve to cause disease in humans and animals (e.g., MERS) and notably appear to be the only bat β-CoVs to diversify among several families of the globally distributed suborder Yangochiroptera (Fig. 2; (*49, 50, 76-78, 83-87*). The several hundred species of extant bats spanning the Americas all belong to the suborder Yangochiroptera, which likely diverged from the Old-World Yinpterochiroptera more than 50 million years ago (Fig. 2; (*88*)). In the Americas, a novel β-CoV of the subgenus *Merbecovirus*

was detected in *Nyctinomops laticaudatus* (family Molossidae), and other distinct lineages in the subgenus *Merbecovirus* were described from *Pteronotus davyii* and *P. personatus* (family Mormoopidae), as well as species of *Artibeus* and *Dermaneura* (family Phyllostomidae) from tropical regions of Mexico (*31, 89, 90*); none of these bat species occur outside of the Neotropics. Successful *in vitro* infection of cells from the Neotropical bat *Artibeus jamaicensis* with MERS-CoV led to experimental infection trials that resulted in virus replication and shedding without obvious clinical signs of disease (*91*). Considering these laboratory findings and detection of only β-CoVs of the subgenus *Merbecovirus* in two exclusively Neotropical bat families (Phyllostomidae & Mormoopidae) and one that is globally distributed (Molossidae), available evidence suggests β-CoVs may have arrived to the New World through South America and have long been evolving in Neotropical bats. β-CoVs of the subgenus *Merbecovirus* are not known to target ACE2 cell receptors, instead using the dipeptidyl peptidase-4 (DPP4/CD26) or possibly other receptors (*41, 92*). Assessing SARS-CoV-2 host range using virus-host receptor binding assays *in silico* and *in vitro* (*14, 41, 92, 93*), together with future experimental infection studies for 'gold standard' confirmation, hold promise to better quantify the potential for NA bat infection. We are not aware of any published detections of β-CoVs in temperate-zone NA vespertilionid bats, although sampling has been limited. Overall, proportionally few studies have looked for CoVs in the approximately 1,400 species of bats occurring across six continents. This sampling deficit limits the inference obtainable by examining known patterns of bat-CoV occurrence and distribution. To our knowledge SARSr-CoVs (*Sarbecovirus spp*; (*41, 77*)) have only been detected in one species of vespertilionid bat in Bulgaria (*81*), a likely transmission from co-roosting *Rhinolophus* sp. bats. This absence of evidence for β-CoVs in temperate-zone bats of NA leaves important gaps in our ability to gauge threats posed by SARS-CoV-2 to bats in the US and Canada.

Figure 1. Global patterns of bats and associated beta-coronaviruses (β-CoVs). A) red-shaded distributions of bat species in which SARS-related β-CoVs of the viral subgenus *Sarbecovirus* were detected; B) pink-shaded distributions of bat species known to host β-CoVs of the subgenus *Hibecovirus*; C) brown-shaded distributions of bats in which β-CoVs of the *Nobecovirus* lineage have been detected; and D) green-shaded distributions of bats known to host MERS-related β-CoVs of the subgenus *Merbecovirus*. Different colors and shade styles within each panel represent different families of bats. See Table S1 for species lists. Maps created using ArcMap (ESRI, Redlands, California, USA) and bat ranges derived from spatial data on terrestrial mammals from the IUCN (https://www.iucnredlist.org/resources/spatial-data-download).

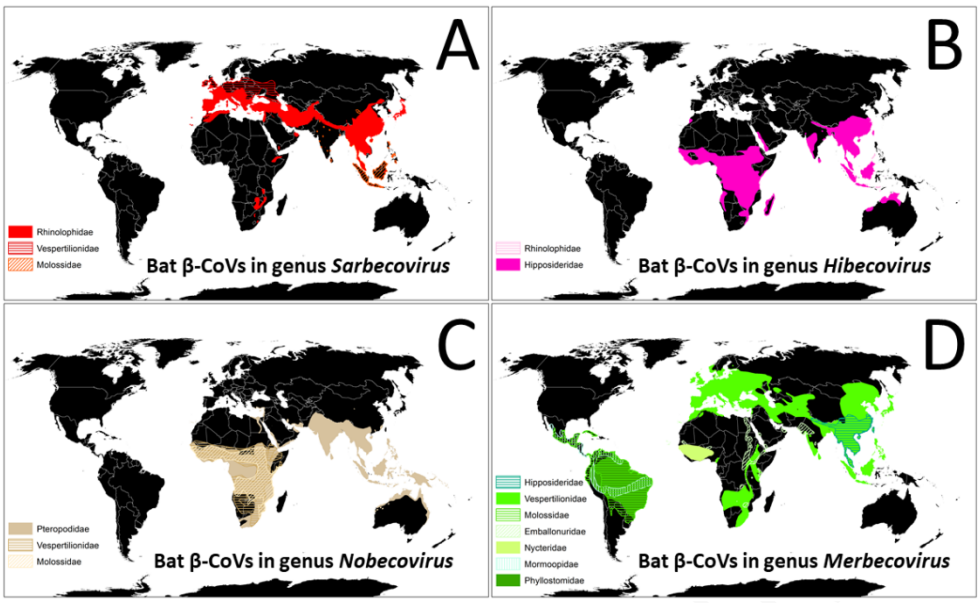

Figure 2. Old-world and new-world bats. Overlapping species distribution outlines of bats in the globally distributed suborder Yangochiroptera (blue) and Old-world Yinpterochiroptera (yellow). Maps created using ArcMap (ESRI, Redlands, California, USA) and bat ranges derived from spatial data on terrestrial mammals from the IUCN (https://www.iucnredlist.org/resources/spatial-data-download).

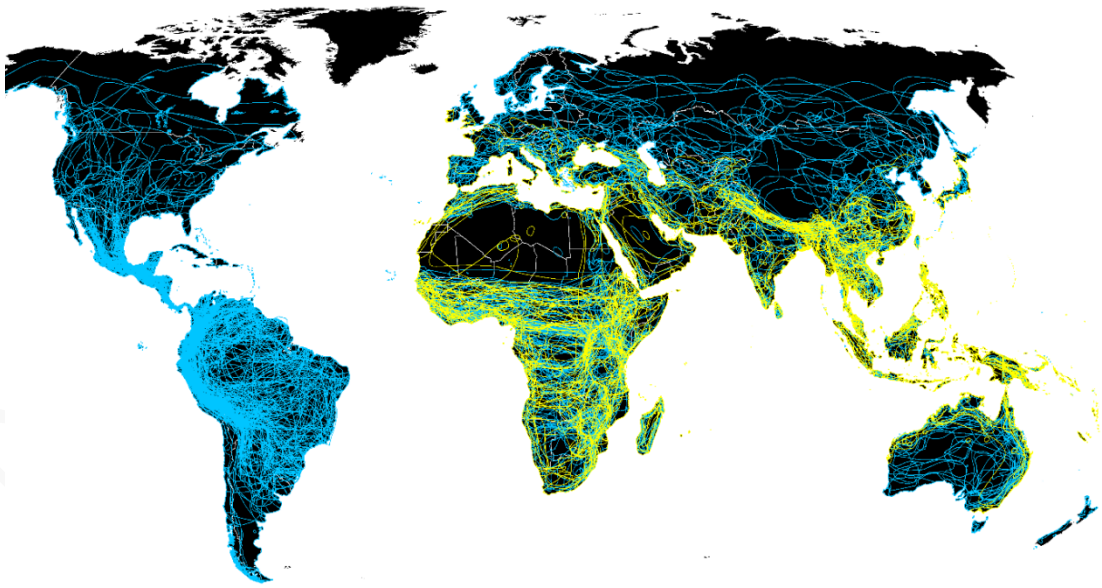

Proactively connecting the wellbeing of human and bat populations

Scientists have long recognized the risk of disease spillback from humans to bats (*94-96*), but bat researchers in NA did not systematically address such risk prior to WNS**.** Few bat

researchers studied infectious diseases in bats before WNS emerged in 2007 (*69*) and proportionally few disease researchers studied bat pathogens before bats were retrospectively connected to the SARS epidemic (*12, 58, 97*). An often unstated duality of such disease responses is the seemingly contradictory facts that bats are unequivocally ecologically important (*33, 34*), yet also a diverse source of emerging infectious diseases (*6, 50, 97-101*). Factors driving the ecologic success of bats are often the same as those invoked for explaining why bats might host such a diversity of viruses. These factors include characteristics of bat life history (e.g., long-lived, slow reproducing, wide dispersal, multi-species aggregations, daily and seasonal torpor (*97*)), unique physiology for repairing damaged DNA (*102*), unique ability to regulate immune response (*103-105*), and unmatched metabolic range and high body temperatures during flight (*106*). Bats also cryptically come into closer contact with humans than many other types of wildlife, often daily crossing human-wildlife interfaces. An oft-overlooked flip side to abundant evidence that many dangerous human diseases originate from bats is the fact that bats rarely show signs of mass mortality and sickness from these same dangerous pathogens (*20*). Bats cope with viral infection in ways that we do not yet fully comprehend but learning how they do so may reveal important insights to develop therapeutics and ultimately protect human health. *In vitro* and laboratory studies demonstrate that bats can regulate immune response to effectively cope with MERS-CoV and SARS-CoV-2 infection, at least under experimental conditions (*104, 107*). Lack of clear signs of sickness in bats and the cryptic habits of many species also generally inhibit our ability to easily detect spillback of pathogens from human to bat populations, further adding to uncertainty about movement of CoVs among groups. Laboratory findings suggest human viruses like HCoV-NL63 may have historically moved back and forth between human and bat populations multiple times (*74*). SARS-CoV-2 and other CoVs are relatively long for RNA viruses, making them susceptible to recombination and copy errors with resulting functional adaptations (e.g., receptor binding ability, temperature adaptation enzymes)(*108*). CoVs can recombine with functional fragments of other virus families, such as when a bat-derived CoV gained a functional gene from a reovirus (*109*). If spillback of SARS-CoV-2 into NA bats led to the virus becoming more pathogenic to bats, domestic animals, or humans through genetic mixing in a NA bat reservoir host, the public-health and conservation consequences would be severe.

Need for an interdisciplinary disease response

Effectively managing risks of human disease caused by emerging zoonotic pathogens *and* ensuring the health and conservation of potential wildlife reservoirs of those disease agents are not mutually exclusive goals. Research has shown that spillover risk (and probably spillback risk) may be highest in disturbed ecosystems where there is a high frequency of human-wildlife interactions (*2, 110, 111*). Thus, effective bat conservation and management requires understanding both pathogens that cause disease in bats, as well as human activities that present health risks in environments we share with bats. Furthermore, seemingly intuitive reactions to disease risk from wildlife, such as culling infected bat populations, often have negative unintended consequences for the interconnected health of both human and bat populations (*112, 113*). Temperate-zone vespertilionid bats inhabiting human dwellings in US and Canada represent a particularly relevant human-wildlife interface where such actions and potential consequences for disease spillback and spillover may be particularly worth careful consideration. A growing field of 'One Health' or conservation-minded bat virus research studies

have demonstrated the potential for mutual benefit of collaboration between public health, disease, and conservation stakeholders (*95, 112, 114-119*). For example, proper use of personal protective equipment (PPE) including respiratory protection has been adopted by the bat virus research community but by few others studying bats. Assessing the risks of SARS-CoV-2 spillback into NA bats seems like a perfect opportunity to integrate and practically apply lessons learned from prior epizootic and pandemic disease responses, and to tap a growing field of CoV experts studying viral transmission, host range, and natural history. Free-ranging bats are notoriously difficult to study, so scientists researching EIDs can benefit from methods bat researchers have developed for observing, counting, and non-invasively sampling bats (*69, 120*). Bat researchers can learn important biosafety, health monitoring, and laboratory techniques from researchers with expertise in veterinary and medical sciences (*117, 118*).

SARS-CoV-2 alters the *status quo* of bat research, emphasizing the need to carefully weigh risks and benefits of wildlife research in the context of population-altering diseases (*121*). Adopting a precautionary approach in the face of widespread COVID-19 transmission, US and international wildlife organizations have begun advising limiting field research to minimize the risk of humans infecting bats with SARS-CoV-2 until further assessment can be made (*122, 123*). A rapid, quantitative risk assessment and analysis of various mitigation options is an urgent research priority and is currently underway (*122*). One key question is if the proper use of PPE and masks, together with other basic biosafety practices (*124*), during field work can significantly reduce the risk of transmission to bats. In the interim, until new guidelines are established for handling and near-proximity work with bats, important scientific inquiry could continue. Temporarily shifting to 'hands-off' bat research methods in temperate-zone NA seems prudent wherever possible. Examples of such methods applicable to both disease and conservation research include: monitoring echolocation calls to determine the occurrence, distributions, and seasonal/nightly activity patterns of bats (*125-128*); digital imaging methods for counting bats and studying physiology and behaviors in the context of disease and anthropogenic landscape change (*19, 129-134*); methods of safely attaching tracking tags and environmental sensors to bats for multi-month periods (*19, 135*); and sampling guano from below bat roosts to determine bat species and individual identity, population dynamics, and daily or seasonal patterns of bat occupancy and pathogen shedding (*68, 136-139*). Promising areas for innovation include making these 'hands off' field technologies more accessible to a broader global user base, less expensive, easier to use, and scientifically reproducible through open-source hardware, software, and laboratory methods (e.g., (*140-146*)). Assessing the risk of SARS-CoV-2 transmission to NA bats also raises critical gaps in knowledge about bat CoV diversity and distribution, particularly in the New World. Standardized field protocols and probabilistic sampling strategies for monitoring bats and their viruses at a continental scale are needed (www.nabatmonitoring.org; (*147-149*). The currently unknown but potentially high-consequence risk of SARS-CoV-2 transmission and establishment in NA bats warrants precaution. We are at a critical nexus of biosecurity and natural resource conservation. Our actions during this current pandemic could profoundly influence the health of both human and bat populations.

Thanks Rebekah, thanks Tigga!

Paul and I are revising and will hopefully have a version that includes everyone's feedback soon, by week's end.

Cheers,
Kevin

Subject: RE: [EXTERNAL] Re: SARS-CoV-2 spillback risk to North American bats

P.S. I looked at the table, and also spotted some things to check in addition to those high-lighted by Rebekah. Perhaps "Region" needs some clarification if it is where the bat was sampled – in the cases below it isn't very representative of the distribution or was impossible

- *Rhinolophus ferrumequinum* is a Eurasian species, just tips into N. Africa
- https://en.wikipedia.org/wiki/Greater_horseshoe_bat

R. sinicus – predominantly Chinese bat -- doesn't get in to Africa
https://en.wikipedia.org/wiki/Chinese_rufous_horseshoe_bat

Taxonomic updates:

FYI *Pteropus giganteus* is no more, it is currently recognized as *P. medius*

Eonycteris spalaea – spelling sp**e**laea

Note that the Hipposiderids have been broken with Rhinonycteridae elevated to family…

family **Rhinonycteridae**. elevated by Foley, *et al*, 2014.[2]
- genus *Cloeotis*
- genus *Brevipalatus*
- genus *Brachipposideros*
- genus *Paratriaenops*
- genus *Rhinonicteris* J.E. Gray, 1847
- genus *Triaenops*

So you might want to update the relevant species.

Subject: RE: [EXTERNAL] Re: SARS-CoV-2 spillback risk to North American bats

Hi Paul and Kevin

Great job, as Rebekah said.

I thought I'd give holistic feedback of possible gaps, inevitably based on commenting on the influence of ecology or at least species variability in possible risk. Despite the fact that you mention there are 40+ species at the beginning, this gets a bit lost and so we end up of perceiving "north American bats" as a single species. This is a trend that I've seen elsewhere in disease papers, in fact I read a risk perception paper recently that managed to get although way through without identifying a single species. It is relevant because, as we've seen with WNS, species have exhibited different responses and we could anticipate different spillback and transmission probabilities among species. This may be a function of differences in species-specific physiology but critically aspects of ecology (especially sociality/roosting ecology) and human-bat interface. So perhaps in the paragraph about interdisciplinary research you could highlight the diversity of bats and their ecology (not just numbers) and the consequences for interspecific differences in risk. (for eg. do you think Lasiurines are as at risk as Myotis?). The implications are essentially that there will never be a simple model system, and we must be very wary of extrapolating from single-species studies, but perhaps current knowledge of bat ecology in N Am (a pretty well known fauna compared to some parts of the world) in combination with virological, genomic and disease ecology expertise could be used to prioritize research.

This leads into whether there could be more strategic research recommendations to close out with. I like the suggestions in the final paragraph on how to implement research and useful contributions that could be made in the study of "north american bats". Closing out with possible priorities or a suggested strategy would make the document even more useful. For example, ensuring surveillance/discovery of the more synanthropic species, colonial species, or species already compromised by WNS, surveil widely across the N. Am phylogeny. Are there particular regions or contexts of N. America that should be the focus of efforts (species-rich caves, peri-urban and urban settings, species-rich geographic areas?). If that all seems too much to be definitive on, perhaps calling for cooperative development of a strategy with these as some suggested areas for consideration could be the way to go.

I think some consideration of the above would improve the MS and position it better in the research community as a springboard for more cohesive collaborative work. You want to guard against "we need more surveillance so give us funding" criticisms. Happy to help on that although my knowledge of N. Am bats is limited as you know, but could work on something about priority setting if you wish.

Minor point.. the SEABCRU link – that goes with the sentence below is actually a good example of how PPE guidance can be developed for ecologists/field researchers. It was based on a decision tree that reflects different contexts, and hence risks, that field biologists might find themselves. (great job Kevin…..) So it better illustrates that this can be done.

Hope this helps
Tigga
Xx

Subject: Re: [EXTERNAL] Re: SARS-CoV-2 spillback risk to North American bats

Hi everyone -

Kevin and Paul - this manuscript is very good - thank you for putting it together!! I'll follow up later today with a few comments on the text. I want to read it again but have to go take care of our mosquito colonies at the moment...the one essential duty we have ongoing! I'm attaching the table in the meantime...very comprehensive, wow! I thought it might be helpful for readers to have a column with the broad geographic region of the coronavirus detection in each of the bats, so I added a column to cover this. In instances where the range of the bat species was fairly extensive, I went with where the sampling occurred in the paper. See if you like it...no worries if you don't think its necessary. A couple details/questions came up while I was working on that though:

- excel line 13 - *Nyctalus leisleri* is a European species but Tao and Tong sampled in Kenya...did they mis-identify or maybe there's an accidental reference error?
- excel line 22 - *Hipposideros pratti* looks like an Asian species but the Tao and Tong reference just sampled from Kenya
- excel line 49 - I changed this to Yinterochiroptera and colored it yellow

Question: Is it worth denoting on the table somehow where there is evidence of cross-species sharing of coronavirus strains? For example lines 44-45 the notes have "Eidolon_CoV" but the virus detections being reported were from *Scotophilus* and *Triaenops*...my interpretation is that the virus detected from those latter two bats was the same strain as was detected in *Eidolon* previously? Is there enough evidence to say anything about viral sharing (i.e. are full genomes available) or do we just leave that go for now? I was just thinking that it might be worthwhile to point out any propensity for transfer of strains between/among bat species because that would have relevance to NA bats too.

More later - thanks again - this is a very nice paper and impressive you put it together so quickly!

Hi Rebekah and Tigga,

Without further adieu, I'm attaching the manuscript draft that Kevin and I put together over the past week and would very much like your input on. Its much leaner and meaner than the rambling draft that went out to the decision-making group last week.

Please take a look if you have the time and consider joining us in trying to get it published somewhere fairly high profile in the coming weeks.

All the best,
Paul

Hi Paul, Kevin, Tigga,

I'll just reply to this thread. Yes, I'd be happy to take a look at the paper as well -- thank you very much for spearheading that effort! As Tigga mentioned we're working on something as well that we'll reach out to you guys separately about. Seems like BOHRN is mobilizing on multiple fronts, which is great to see.

Take care and talk to you soon -
Rebekah

Hi Paul
Very interested to see the MS. Rebekah and I have been working on something that arose out of BOHRN that would be very complementary and might be worth trying to coordinate dissemination in some way. We are meeting today and will take stock of where we are at.

I just started an email to you and Kevin about the state of affairs as we Rodrigo and I are getting quite a bit of push-back on the IUCN BSG recommendation to suspend field studies while further data are gathered (primarily from western scientists with access to PPE). It would be good to hear what those committees are finding sooner rather than later.

Best wishes
Tigga

Subject: SARS-CoV-2 spillback risk to North American bats

Hi Tigga,

Sorry for the silence since my call for help about the risks of humans potentially infecting bats in North America with the SARS-CoV-2 virus. Thanks for your patience and willingness to get involved in what we're hoping can be another disease response where scientists coming at disparate aspects of bats and pathogens can help each other. Those of us in the bat research world that focused most of our past efforts in the U.S. on conservation and management of bat populations can certainly use your expertise and help adjusting to the new situation.

A lot happened during my silence. Another group in USGS has been working at the behest of decision makers across federal and state natural resource management agencies to pull off a formal risk assessment by querying a subset of the experts we've reached out to. You lucked out and were not chosen for that exercise (yet), but we will keep you posted on the outcomes of that rapid assessment.

The other thing keeping me silent over the past couple of weeks is a short manuscript (currently 5 pages single spaced) that Kevin Olival and I drafted to articulate the potential risks of humans infecting North American temperate-zone bats with SARS-CoV-2, potentially relevant patterns we observed in bat-CoV distributions at a global scale, and the likely benefits of disease and bat researchers working together to draw on the strengths of our various disciplines. We hope to have a draft to circulate by tomorrow and would appreciate input and feedback from any of you willing to read it and help us stress test the concepts and assertions therein. Please let me know if you are interested.

Thanks again for your help and patience.

All the best,
Paul

This is a trend that I've seen elsewhere in disease papers, in fact I read a risk perception paper recently that managed to get although way through without identifying a single species. It is relevant because, as we've seen with WNS, species have exhibited different responses and we could anticipate different spillback and transmission probabilities among species. This may be a function of differences in species-specific physiology but critically aspects of ecology (especially sociality/roosting ecology) and human-bat interface. So perhaps in the paragraph about interdisciplinary research you could highlight the diversity of bats and their ecology (not just numbers) and the consequences for interspecific differences in risk. (for eg. do you think Lasiurines are as at risk as Myotis?). The implications are essentially that there will never be a simple model system, and we must be very wary of extrapolating from single-species studies, but perhaps current knowledge of bat ecology in N Am (a pretty well known fauna compared to some parts of the world) in combination with virological, genomic and disease ecology expertise could be used to prioritize research.

This leads into whether there could be more strategic research recommendations to close out with. I like the suggestions in the final paragraph on how to implement research and useful contributions that could be made in the study of "north american bats". Closing out with possible priorities or a suggested strategy would make the document even more useful. For example, ensuring surveillance/discovery of the more synanthropic species, colonial species, or species already compromised by WNS, surveil widely across the N. Am phylogeny. Are there particular regions or contexts of N. America that should be the focus of efforts (species-rich caves, peri-urban and urban settings, species-rich geographic areas?). If that all seems too much to be definitive on, perhaps calling for cooperative development of a strategy with these as some suggested areas for consideration could be the way to go.

I think some consideration of the above would improve the MS and position it better in the research community as a springboard for more cohesive collaborative work. You want to guard against "we need more surveillance so give us funding" criticisms. Happy to help on that although my knowledge of N. Am bats is limited as you know, but could work on something about priority setting if you wish.

Minor point.. the SEABCRU link – that goes with the sentence below is actually a good example of how PPE guidance can be developed for ecologists/field researchers. It was based on a decision tree that reflects different contexts, and hence risks, that field biologists might find themselves. (great job Kevin…..) So it better illustrates that this can be done.

Hope this helps
Tigga

Subject: Re: [EXTERNAL] Re: SARS-CoV-2 spillback risk to North American bats

Hi everyone -

Kevin and Paul - this manuscript is very good - thank you for putting it together!! I'll follow up later today with a few comments on the text. I want to read it again but have to go take care of our mosquito colonies at the moment...the one essential duty we have ongoing! I'm attaching the table in the meantime...very comprehensive, wow! I thought it might be helpful for readers to have a column with the broad geographic region of the coronavirus detection in each of the bats, so I added a column to cover this. In instances where the range of the bat species was fairly extensive, I went with where the sampling occurred in the paper. See if you like it...no worries if you don't think its necessary. A couple details/questions came up while I was working on that though:

- excel line 13 - *Nyctalus leisleri* is a European species but Tao and Tong sampled in Kenya...did they mis-identify or maybe there's an accidental reference error?
- excel line 22 - *Hipposideros pratti* looks like an Asian species but the Tao and Tong reference just sampled from Kenya
- excel line 49 - I changed this to Yinterochiroptera and colored it yellow

Question: Is it worth denoting on the table somehow where there is evidence of cross-species sharing of coronavirus strains? For example lines 44-45 the notes have "Eidolon_CoV" but the virus detections being reported were from *Scotophilus* and *Triaenops*...my interpretation is that the virus detected from those latter two bats was the same strain as was detected in *Eidolon* previously? Is there enough evidence to say anything about viral sharing (i.e. are full genomes available) or do we just leave that go for now? I was just thinking that it might be worthwhile to point out any propensity for transfer of strains between/among bat species because that would have relevance to NA bats too.

More later - thanks again - this is a very nice paper and impressive you put it together so quickly!

Hi Rebekah and Tigga,

Without further adieu, I'm attaching the manuscript draft that Kevin and I put together over the past week and would very much like your input on. Its much leaner and meaner than the rambling draft that went out to the decision-making group last week.

Please take a look if you have the time and consider joining us in trying to get it published somewhere fairly high profile in the coming weeks.

All the best,
Paul

Hi Paul, Kevin, Tigga,

I'll just reply to this thread. Yes, I'd be happy to take a look at the paper as well -- thank you very much for spearheading that effort! As Tigga mentioned we're working on something as well that we'll reach out to you guys separately about. Seems like BOHRN is mobilizing on multiple fronts, which is great to see.

Take care and talk to you soon -

Hi Paul
Very interested to see the MS. Rebekah and I have been working on something that arose out of BOHRN that would be very

complementary and might be worth trying to coordinate dissemination in some way. We are meeting today and will take stock of where we are at.

I just started an email to you and Kevin about the state of affairs as we Rodrigo and I are getting quite a bit of push-back on the IUCN BSG recommendation to suspend field studies while further data are gathered (primarily from western scientists with access to PPE). It would be good to hear what those committees are finding sooner rather than later.

Best wishes
Tigga

Subject: SARS-CoV-2 spillback risk to North American bats

Hi Tigga,

Sorry for the silence since my call for help about the risks of humans potentially infecting bats in North America with the SARS-CoV-2 virus. Thanks for your patience and willingness to get involved in what we're hoping can be another disease response where scientists coming at disparate aspects of bats and pathogens can help each other. Those of us in the bat research world that focused most of our past efforts in the U.S. on conservation and management of bat populations can certainly use your expertise and help adjusting to the new situation.

A lot happened during my silence. Another group in USGS has been working at the behest of decision makers across federal and state natural resource management agencies to pull off a formal risk assessment by querying a subset of the experts we've reached out to. You lucked out and were not chosen for that exercise (yet), but we will keep you posted on the outcomes of that rapid assessment.

The other thing keeping me silent over the past couple of weeks is a short manuscript (currently 5 pages single spaced) that Kevin Olival and I drafted to articulate the potential risks of humans infecting North American temperate-zone bats with SARS-CoV-2, potentially relevant patterns we observed in bat-CoV distributions at a global scale, and the likely benefits of disease and bat researchers working together to draw on the strengths of our various disciplines. We hope to have a draft to circulate by tomorrow and would appreciate input and feedback from any of you willing to read it and help us stress test the concepts and assertions therein. Please let me know if you are interested.

Thanks again for your help and patience.

All the best,
Paul

Dear all,

We successfully submitted to bioRxiv yesterday and it's currently in "review" with the editorial staff and should be posted within 48 hours. Big thanks to Paul for getting the final USGS approvals and ms formatting in place.

Hume and Charlie, I understand your very valid and "traditional" concerns here, there's a lot of riff-raff out there on pre-print servers and hence why we have the peer-review system. Nonetheless, given that there are other similar reviews being posted at the moment and the timeliness of this given the USGS/USFW Risk Assessment out last week, etc., would be best to get this out there while we're still in review at PLOS.

Best,
Kevin

Dear all,

Update on our ms. It was submitted to PLOS Pathogens on June 2nd (you should have all received an email from the journal confirming this) and it is currently under review.

We are in the final stages of USGS approval to also submit to bioRxiv (pre-print server), and expect to finalize that and post it on bioRxiv in the next 24 hours. *Please let me know if there are any objections.*

Cheers,
Kevin

Dear Co-authors,

Attached is the latest, submission ready version of our paper "**Possible risks of SARS-CoV-2 spillover to free-ranging wildlife: a case study of bats**". Thank you all for the last round of invaluable edits and comments. Paul and I have now gone through multiple revisions since you last saw the paper in an attempt to include everyone's feedback; so apologize for the delay in turning this around and moving towards submission.

We started a submission to *Lancet Infectious Diseases*, but after thinking more about the journal's scope and reading other recent reviews that have been published in the journal, Paul and I decided it was not the best fit after all. We instead plan to submit this as a Perspectives article to *PNAS*(https://www.pnas.org/page/authors/purpose-scope). We think *PNAS* is a better fit all around, especially given the US focus of our review. We are currently following up some leads for "sponsorship" of our paper with PNAS which would make it an invited piece. If you have any specific suggestions in this regard, please let me know.

As before, the plan is once we submit (hopefully this week) to *PNAS* we will also post as a pre-print on BioRxiv so it can be viewed and used immediately. **If there are any objections to this plan or to submit to *PNAS*, please let me know.**
Also, for those that have secured USG approval already, please let me know if these needs to be updated or if you need any more information.

This has been a fantastic exercise in group writing! Big thank you to everyone.

Cheers,
Kevin

Thanks Kevin and Paul for doing a great job so quickly.

I guess the CNN documentary yesterday also made this a hot (hotter) topic now and the editor may want to have “a ride on the bat wings” to get it out asap!

Fingers crossed.

Hi Team,

Funny thing, bioRxiv actually rejected us! Apparently they don’t take “reviews”.

In any case we got **very positive reviews back from *PLoS Pathogens*** today, and the revised ms was just resubmitted (<24 hour turnaround). Woohooo! Finger’s crossed that the editors turn it around again quickly and we can see this published soon.

Attached is the cover letter, response to reviewers, and the resubmitted version of ms.

Cheers,
Kevin and Paul

We think *PNAS* is a better fit all around, especially given the US focus of our review. We are currently following up some leads for "sponsorship" of our paper with PNAS which would make it an invited piece. If you have any specific suggestions in this regard, please let me know.

As before, the plan is once we submit (hopefully this week) to *PNAS* we will also post as a pre-print on BioRxiv so it can be viewed and used immediately. **If there are any objections to this plan or to submit to *PNAS*, please let me know.**
Also, for those that have secured USG approval already, please let me know if these needs to be updated or if you need any more information.

This has been a fantastic exercise in group writing! Big thank you to everyone.

Cheers,
Kevin

Thanks Kevin and Paul for doing a great job so quickly.

I guess the CNN documentary yesterday also made this a hot (hotter) topic now and the editor may want to have “a ride on the bat wings” to get it out asap!

Fingers crossed.

Hi Team,

Funny thing, bioRxiv actually rejected us! Apparently they don't take "reviews".

In any case we got **very positive reviews back from *PLoS Pathogens*** today, and the revised ms was just resubmitted (<24 hour turnaround). Woohooo! Finger's crossed that the editors turn it around again quickly and we can see this published soon.

Attached is the cover letter, response to reviewers, and the resubmitted version of ms.

Cheers,
Kevin and Paul

>
> Hume and Charlie, I understand your very valid and "traditional" concerns here, there's a lot of riff-raff out there on pre-print servers and hence why we have the peer-review system. Nonetheless, given that there are other similar reviews being posted at the moment and the timeliness of this given the USGS/USFW Risk Assessment out last week, etc., would be best to get this out there while we're still in review at PLOS.

Hi Folks,

Quick update on our paper — unfortunately got news yesterday that *PNAS* was not interested in this as a Perspectives piece, and rejected our proposal. We are currently pursuing options with editors at *PLOS Pathogens* to see if they want it as a review. Will keep you all posted.

Latest version attached that has cleared CDC and USGS review. We will still aim to get this on BioRxiv, but wanted to wait until we had it cleared first and ideally in review at a journal.

Cheers,
Kevin

Hi Megan,

Regrettably, I'm not going to be able to make it to Austria for the BOHRN meeting. A couple of research projects I'm overseeing are bleeding into the late autumn and early winter here in Colorado and I need to stay put to keep them on track. Please keep me in the loop and let me know if there ways I can somehow help or participate remotely.

Thanks,
Paul

Subject: BOHRN November IMED Meeting Invitation

All,

On behalf of Dr. Marty Stokes you are receiving this email, as part of a save the date to attend our BOHRN Steering Committee meeting and International Meeting on Emerging Diseases and Surveillance (IMED) 8 – 12 November 2018 in Vienna, Austria.

Our meeting will take place on 8 – 9 November (hotel/meeting location TBD). The BOHRN steering committee meeting will aim to meet the objectives the group identified in Saskatoon. The following objectives were suggested based on your survey responses:

1. Prioritizes funding needs based on working groups' characterization of gaps and needs, to help organize and develop funding initiatives; and
2. Analyze progress of action plans and their yields establishing collaborate and sustainable projects

To facilitate these objectives, we will be asking each working group to present their progress. The progress updates for each working group are imperative to the outcomes for this meeting.

As discussed during the June BOHRN meeting, an objective of this meeting is to develop our outreach and populate working groups. Please send any nominations of subject matter experts or other participants who would be beneficial to this discussion **no later than 10 September 2018**.

IMED will take place 9 – 12 November at the Hilton Vienna. The 2018 IMED will focus on innovation and changes in political and societal responses to outbreaks. The theme of IMED aligns with our overall BOHRN objectives and we encourage all BOHRN

members to stay and participant in the conference. **Therefore, we need you to confirm your attendance to BOHRN and IMED NLT 14 September.**

v/r,

Megan

Most memorable line from the whole CNN piece: Dan Riskin describing how awesome mother bats are using the analogy of "attaching a jumper cable to his nipple with a 50 pound weight and going for a jog". :-) Seriously though, I think they did a great job balancing the conservation and disease messaging, and great to see so many of our coauthors featured! Kudos to Peter, Jon, Cara, Ralph, and Linfa…

Cheers,
Kevin

Hi Team,

Funny thing, bioRxiv actually rejected us! Apparently they don't take "reviews".

In any case we got **very positive reviews back from *PLoS Pathogens*** today, and the revised ms was just resubmitted (<24 hour turnaround). Woohooo! Finger's crossed that the editors turn it around again quickly and we can see this published soon.

Attached is the cover letter, response to reviewers, and the resubmitted version of ms.

Cheers,
Kevin and Paul

Dear all,

We successfully submitted to bioRxiv yesterday and it's currently in "review" with the editorial staff and should be posted within 48 hours. Big thanks to Paul for getting the final USGS approvals and ms formatting in place.

Hume and Charlie, I understand your very valid and "traditional" concerns here, there's a lot of riff-raff out there on pre-print servers and hence why we have the peer-review system. Nonetheless, given that there are other similar reviews being posted at the moment and the timeliness of this given the USGS/USFW Risk Assessment out last week, etc., would be best to get this out there while we're still in review at PLOS.

Best,
Kevin

Dear all,

Update on our ms. It was submitted to PLOS Pathogens on June 2nd (you should have all received an email from the journal confirming this) and it is currently under review.

We are in the final stages of USGS approval to also submit to bioRxiv (pre-print server), and expect to finalize that and post it on bioRxiv in the next 24 hours. *Please let me know if there are any objections.*

Cheers,
Kevin

Most memorable line from the whole CNN piece: Dan Riskin describing how awesome mother bats are using the analogy of "attaching a jumper cable to his nipple with a 50 pound weight and going for a jog". :-) Seriously though, I think they did a great job balancing the conservation and disease messaging, and great to see so many of our coauthors featured! Kudos to Peter, Jon, Cara, Ralph, and Linfa…

Thanks Kevin and Paul for doing a great job so quickly.

I guess the CNN documentary yesterday also made this a hot (hotter) topic now and the editor may want to have “a ride on the bat wings” to get it out asap!

Fingers crossed.

Thanks Kevin and Paul for doing a great job so quickly.

I guess the CNN documentary yesterday also made this a hot (hotter) topic now and the editor may want to have "a ride on the bat wings" to get it out asap!

Fingers crossed.

Hi Team,

Funny thing, bioRxiv actually rejected us! Apparently they don't take "reviews".

In any case we got **very positive reviews back from *PLoS Pathogens*** today, and the revised ms was just resubmitted (<24 hour turnaround). Woohooo! Finger's crossed that the editors turn it around again quickly and we can see this published soon.

Attached is the cover letter, response to reviewers, and the resubmitted version of ms.

Cheers,
Kevin and Paul

Dear all,

Update on our ms. It was submitted to PLOS Pathogens on June 2nd (you should have all received an email from the journal confirming this) and it is currently under review.

We are in the final stages of USGS approval to also submit to bioRxiv (pre-print server), and expect to finalize that and post it on bioRxiv in the next 24 hours. *Please let me know if there are any objections.*

Cheers,
Kevin

Agreed, great job Kevin and Paul for the quick turnaround.

The CNN special can be viewed on www.cnn.com/go, click on “Shows” to the left-side of the screen and the special should be an option at the top of the screen (or one scroll to the right). I think you need a cable subscription to log-in to view though.

Cheers,
Kendra

Ditto here! Thanks for turning this around so quickly - nice to get such positive feedback from the reviewers!

Ditto also on the CNN special - which was really put together well! I was tickled that they included my "panda bat" - one of you must have turned them on to this lovely beastie!

Dear all,

We successfully submitted to bioRxiv yesterday and it's currently in "review" with the editorial staff and should be posted within 48 hours. Big thanks to Paul for getting the final USGS approvals and ms formatting in place.

Hume and Charlie, I understand your very valid and "traditional" concerns here, there's a lot of riff-raff out there on pre-print servers and hence why we have the peer-review system. Nonetheless, given that there are other similar reviews being posted at the moment and the timeliness of this given the USGS/USFW Risk Assessment out last week, etc., would be best to get this out there while we're still in review at PLOS.

Best,
Kevin

Hi Folks,

Quick update on our paper — unfortunately got news yesterday that *PNAS* was not interested in this as a Perspectives piece, and rejected our proposal. We are currently pursuing options with editors at *PLOS Pathogens* to see if they want it as a review. Will keep you all posted.

Latest version attached that has cleared CDC and USGS review. We will still aim to get this on BioRxiv, but wanted to wait until we had it cleared first and ideally in review at a journal.

Cheers,
Kevin

On 12 May 2020, at 10:13 PM, Kevin Olival ecohealthalliance.org> wrote:

Dear Co-authors,

Attached is the latest, submission ready version of our paper "**Possible risks of SARS-CoV-2 spillover to free-ranging wildlife: a case study of bats**". Thank you all for the last round of invaluable edits and comments. Paul and I have now gone through multiple revisions since you last saw the paper in an attempt to include everyone's feedback; so apologize for the delay in turning this around and moving towards submission.

We started a submission to *Lancet Infectious Diseases*, but after thinking more about the journal's scope and reading other recent reviews that have been published in the journal, Paul and I decided it was not the best fit after all. We instead plan to submit this as a Perspectives article to *PNAS*(https://www.pnas.org/page/authors/purpose-scope). We think *PNAS* is a better fit all around, especially given the US focus of our review. We are currently following up some leads for "sponsorship" of our paper with PNAS which would make it an invited piece. If you have any specific suggestions in this regard, please let me know.

As before, the plan is once we submit (hopefully this week) to *PNAS* we will also post as a pre-print on BioRxiv so it can be viewed and used immediately. **If there are any objections to this plan or to submit to *PNAS*, please let me know.** Also, for those that have secured USG approval already, please let me know if these needs to be updated or if you need any more information.

This has been a fantastic exercise in group writing! Big thank you to everyone.

Cheers,
Kevin

Hi Guzal,
Thanks for clarifying the password situation (I was only going partially mad then -- possible I never had that password, rather than I'd forgotten it (more often the case)).
Yes let's get rid of the login feature for now, and meet Friday 10 CT. I'd prefer Zoom as I've not yet used MS Teams. I imagine this will be mostly a "scoping" meeting, with practical changes to follow.

Best wishes
Tigga

Subject: Re: [Non-DoD Source] Re: [External Sender] RE: BOHRN Status, publication

Hi Tigga,

We're behind the scenes right now talking to Squarespace, and there were never any profiles created with usernames/passwords. Whenever you see a "login" button on the website, it leads you to a page with a single password entry space - this was a universal password that we set to hide some pages so only certain people could access them. An outcome of Phuket was to add an interactive map and chat feature that would need assigned logins / passwords to protect the information – but we were not able to get approvals to move forward with that next phase. This is still a likely objective for the network. However, since those pages are as of now blank, I suggest we get rid of the "login" feature altogether to get rid of the confusion.

If you wanted to update website content/bios/pages, I am happy to offer the Squarespace administrative login info that lets you change/make edits to the entire website. It's pretty intuitive, but I'll be available to make those changes for you or provide tech support if you wanted to go in yourself. We can also do a screen-sharing scenario during our call and I can live edit - I am flexible. __

Friday 10 - noon CT / 11 - 1 EST works with me. Does a Teams call invitation work or do you prefer Zoom?

Thank you,

Hi Katie, Marty, and Guzal -

Just chiming in to say hello and THANK YOU for the quick response and support for this effort! This is all great to hear, and I think we have a fantastic opportunity with this paper to provide another way to invigorate and draw attention to BOHRN. As Tigga and I were discussing the reviewer's suggestion, we basically converged on "Hey, BOHRN has already done all of this!" So it is wonderful to hear that we can move forward together to use this paper to direct people to BOHRN, which is where the rubber will hit the road. Looking forward to moving this forward, and we'll keep in touch with the revised manuscript. Thanks!

Best,
Rebekah :-)

publication

Hi Tigga,

Congratulations on having your piece accepted (with revisions, as always)! I would really appreciate you adding detail about BOHRN and highlighting the network's efforts. All of the positive outcomes you mention are well noted and align with our goals and objectives, which remain steadfast.

The current situation has certainly created unexpected challenges for all our work, but we're adapting, and want to ensure that we continue moving forward and position the network to pick up where it left off last summer, once things return to a more normal environment. In the meantime, we'll do what we are able virtually.

Let us know what you need to support this. Katie and I, along with our teams, recently updated a huge amount of documentation, reports, participant lists, etc. for BOHRN and other our TRNs for the incoming BTRP Director, in order to deposit it on our internal database, so it should be very easy to provide whatever you need. Just let us know how we can help.

Thanks so much!

Best,

Marty

Subject: [External Sender] BOHRN Status, publication

Dear Marty,

Rebekah Kading and I wrote a perspectives piece that is in revision for PLOS Biology. It calls for greater integration of ecologists/virologists (hmm, sounds familiar) and builds on analysis of a publication coauthor network. We conceptualized this at BORHN meetings and consider it a true BOHRN output, supporting BOHRN's message.

One of the reviewers specified some simple, but concrete actions that they would like to see in the revision. These actions closely ally with things we've begun at BOHRN (e.g., mission statement, contact lists of researchers). We would really like to be able to respond using BOHRN's infrastructure as it would be a good fit and would draw substantial attention to BOHRN and help boost the distributed membership and get us more on the map. The reviewer called for a mission statement, a list of who is doing what, and other simple things that could easily be integrated into the BOHRN website.

Currently, we refer to BOHRN in the acknowledgements, but have been reluctant to feature the network too centrally because we are unsure of its status and stability. It would be great to move forward with BOHRN featured more prominently, but we could do with some clarity of where things are heading. At minimum we need support of the website as that is where we will be directing people. Currently people can't join, or reset passwords etc, and we would need to work with someone on updates supporting these simple collations of information.

We have a bit less than a month to turn this around and get our revision in, so it would be great to hear your thoughts. I hope we can talk soon. I am now free fairly consistently between 10 am-Noon Mo-Thursday. I have other windows here and there as well.

All the best

Tigga

This was initially installed because we intended to add geographic information of BOHRN members that we didn't want the public to have access to without permission. However, that information was never set up so we may want to consider removing the login feature of the website altogether.

Please let me know how you'd like to proceed - I'm happy to make changes based on updates you send me over email or I can set up a virtual meeting for us as well.

I look forward to helping out.

Hi Katie, Marty, and Guzal -

Just chiming in to say hello and THANK YOU for the quick response and support for this effort! This is all great to hear, and I think we have a fantastic opportunity with this paper to provide another way to invigorate and draw attention to BOHRN. As Tigga and I were discussing the reviewer's suggestion, we basically converged on "Hey, BOHRN has already done all of this!" So it is wonderful to hear that we can move forward together to use this paper to direct people to BOHRN, which is where the rubber will hit the road. Looking forward to moving this forward, and we'll keep in touch with the revised manuscript. Thanks!

Best,
Rebekah :-)

Dear Marty

Thanks for the speedy response and support! Great to hear of the documentation efforts and continued commitment.

The lynchpin to everything that we'd like to do is the BOHRN website - is there a webmaster, or can one be allocated, so that we can host content, build membership, post some of the materials that have been developed.

Best

Hi Tigga,

Congratulations on having your piece accepted (with revisions, as always)! I would really appreciate you adding detail about BOHRN and highlighting the network's efforts. All of the positive outcomes you mention are well noted and align with our goals and objectives, which remain steadfast.

The current situation has certainly created unexpected challenges for all our work, but we're adapting, and want to ensure that we continue moving forward and position the network to pick up where it left off last summer, once things return to a more normal environment. In the meantime, we'll do what we are able virtually.

Let us know what you need to support this. Katie and I, along with our teams, recently updated a huge amount of documentation, reports, participant lists, etc. for BOHRN and other our TRNs for the incoming BTRP Director, in order to deposit it on our internal database, so it should be very easy to provide whatever you need. Just

let us know how we can help.

Thanks so much!

Best,

Marty

Subject: [External Sender] BOHRN Status, publication

Dear Marty,

Rebekah Kading and I wrote a perspectives piece that is in revision for PLOS Biology. It calls for greater integration of ecologists/virologists (hmm, sounds familiar) and builds on analysis of a publication coauthor network. We conceptualized this at BORHN meetings and consider it a true BOHRN output, supporting BOHRN's message.

One of the reviewers specified some simple, but concrete actions that they would like to see in the revision. These actions closely ally with things we've begun at BOHRN (e.g., mission statement, contact lists of researchers). We would really like to be able to respond using BOHRN's infrastructure as it would be a good fit and would draw substantial attention to BOHRN and help boost the distributed membership and get us more on the map. The reviewer called for a mission statement, a list of who is doing what, and other simple things that could easily be integrated into the BOHRN website.

Currently, we refer to BOHRN in the acknowledgements, but have been reluctant to feature the network too centrally because we are unsure of its status and stability. It would be great to move forward with BOHRN featured more prominently, but we could do with some clarity of where things are heading. At minimum we need support of the website as that is where we will be directing people. Currently people can't join, or reset passwords etc, and we would need to work with someone on updates supporting these simple collations of information.

We have a bit less than a month to turn this around and get our revision in, so it would be great to hear your thoughts. I hope we can talk soon. I am now free fairly consistently between 10 am-Noon Mo-Thursday. I have other windows here and there as well.

All the best

Subject: Re: [Non-DoD Source] Re: [External Sender] RE: BOHRN Status, publication

Hi Tigga,

We're behind the scenes right now talking to Squarespace, and there were never any profiles created with usernames/passwords. Whenever you see a "login" button on the website, it leads you to a page with a single password entry space - this was a universal password that we set to hide some pages so only certain people could access them. An outcome of Phuket was to add an interactive map and chat feature that would need assigned logins / passwords to protect the information – but we were not able to get approvals to move forward with that next phase. This is still a likely objective for the network. However, since those pages are as of now blank, I suggest we get rid of the "login" feature altogether to get rid of the confusion.

If you wanted to update website content/bios/pages, I am happy to offer the Squarespace administrative login info that lets you change/make edits to the entire website. It's pretty intuitive, but I'll be available to make those changes for you or provide tech support if you wanted to go in yourself. We can also do a screen-sharing scenario during our call and I can live edit - I am flexible. __

Friday 10 - noon CT / 11 - 1 EST works with me. Does a Teams call invitation work or do you prefer Zoom?

Thank you,

Most immediate -- I've forgotten my login password and there's no way to reset, and I'd like to be able to get behind the login. Is it possible to reset my password behind the scenes and send me a new one? I think Rebekah will need one too.

Rebekah and I plan to meet tomorrow, and then think it would be helpful to talk with you virtually on Friday or Monday, if you have the time. Our current options are
Friday -- 10-noon CT
Monday 10-11 CT.

But we can try and free up other slots if those don't work.

Best wishes
Tigga

Hi everyone,

I now have the administrative rights for the BOHRN website from Squarespace. I apologize about the delay; it was a little confusing because of the login requirement on the landing page. This was initially installed because we intended to add geographic information of BOHRN members that we didn't want the public to have access to without permission. However, that information was never set up so we may want to consider removing the login feature of the website altogether.

Please let me know how you'd like to proceed - I'm happy to make changes based on updates you send me over email or I can set up a virtual meeting for us as well.

I look forward to helping out.

In the meantime, we'll do what we are able virtually.

Let us know what you need to support this. Katie and I, along with our teams, recently updated a huge amount of documentation, reports, participant lists, etc. for BOHRN and other our TRNs for the incoming BTRP Director, in order to deposit it on our internal database, so it should be very easy to provide whatever you need. Just let us know how we can help.

Thanks so much!

Best,

Marty

Subject: [External Sender] BOHRN Status, publication

Dear Marty,

Rebekah Kading and I wrote a perspectives piece that is in revision for PLOS Biology. It calls for greater integration of ecologists/virologists (hmm, sounds familiar) and builds on analysis of a publication coauthor network. We conceptualized this at BORHN meetings and consider it a true BOHRN output, supporting BOHRN's message.

One of the reviewers specified some simple, but concrete actions that they would like to see in the revision. These actions closely ally with things we've begun at BOHRN (e.g., mission statement, contact lists of researchers). We would really like to be able to respond using BOHRN's infrastructure as it would be a good fit and would draw substantial attention to BOHRN and help boost the distributed membership and get us more on the map. The reviewer called for a mission statement, a list of who is doing what, and other simple things that could easily be integrated into the BOHRN website.

Currently, we refer to BOHRN in the acknowledgements, but have been reluctant to feature the network too centrally because we are unsure of its status and stability. It would be great to move forward with BOHRN featured more prominently, but we could do with some clarity of where things are heading. At minimum we need support of the website as that is where we will be directing people. Currently people can't join, or reset passwords etc, and we would need to work with someone on updates supporting these simple collations of information.

We have a bit less than a month to turn this around and get our revision in, so it would be great to hear your thoughts. I hope we can talk soon. I am now free fairly consistently between 10 am-Noon Mo-Thursday. I have other windows here and there as well.

All the best

Hi Katie, Marty, and Guzal -

Just chiming in to say hello and THANK YOU for the quick response and support for this effort! This is all great to hear, and I think we have a fantastic opportunity with this paper to provide another way to invigorate and draw attention to BOHRN. As Tigga and I were discussing the reviewer's suggestion, we basically converged on "Hey, BOHRN has already done all of this!" So it is wonderful to hear that we can move forward together to use this paper to direct people to BOHRN, which is where the rubber will hit the road. Looking forward to moving this forward, and we'll keep in touch with the revised manuscript. Thanks!

Best,
Rebekah :-)

Hi Tigga,

Congratulations on having your piece accepted (with revisions, as always)! I would really appreciate you adding detail about BOHRN and highlighting the network's efforts. All of the positive outcomes you mention are well noted and align with our goals and objectives, which remain steadfast.

The current situation has certainly created unexpected challenges for all our work, but we're adapting, and want to ensure that we continue moving forward and position the network to pick up where it left off last summer, once things return to a more normal environment. In the meantime, we'll do what we are able virtually.

Let us know what you need to support this. Katie and I, along with our teams, recently updated a huge amount of documentation, reports, participant lists, etc. for BOHRN and other our TRNs for the incoming BTRP Director, in order to deposit it on our internal database, so it should be very easy to provide whatever you need. Hi Guzal,
Thanks for clarifying the password situation (I was only going partially mad then -- possible I never had that password, rather than I'd forgotten it (more often the case)).
Yes let's get rid of the login feature for now, and meet Friday 10 CT. I'd prefer Zoom as I've not yet used MS Teams. I imagine this will be mostly a "scoping" meeting, with practical changes to follow.

Best wishes
Tigga

Hi Tigga,

We're behind the scenes right now talking to Squarespace, and there were never any profiles created with usernames/passwords. Whenever you see a "login" button on the website, it leads you to a page with a single password entry space - this was a universal password that we set to hide some pages so only certain people could access them. An outcome of Phuket was to add an interactive map and chat feature that would need assigned logins / passwords to protect the information – but we were not able to get approvals to move forward with that next phase. This is still a likely objective for the network. However, since those pages are as of now blank, I suggest we get rid of the "login" feature altogether to get rid of the confusion.

If you wanted to update website content/bios/pages, I am happy to offer the Squarespace administrative login info that lets you change/make edits to the entire website. It's pretty intuitive, but I'll be available to make those changes for you or provide tech support if you wanted to go in yourself. We can also do a screen-sharing scenario during our call and I can live edit - I am flexible. __

Friday 10 - noon CT / 11 - 1 EST works with me. Does a Teams call invitation work or do you prefer Zoom?

Thank you,

Dear Guzal
That's great to hear!

Most immediate -- I've forgotten my login password and there's no way to reset, and I'd like to be able to get behind the login. Is it possible to reset my password behind the scenes and send me a new one? I think Rebekah will need one too.

Rebekah and I plan to meet tomorrow, and then think it would be helpful to talk with you virtually on Friday or Monday, if you have the time. Our current options are
Friday -- 10-noon CT
Monday 10-11 CT.

But we can try and free up other slots if those don't work.

Best wishes
Tigga

Hi everyone,

I now have the administrative rights for the BOHRN website from Squarespace. I apologize about the delay; it was a little confusing because of the login requirement on the landing page. This was initially installed because we intended to add geographic information of BOHRN members that we didn't want the public to have access to without permission. However, that information was never set up so we may want to consider removing the login feature of the website altogether.

Please let me know how you'd like to proceed - I'm happy to make changes based on updates you send me over email or I can set up a virtual meeting for us as well.

I look forward to helping out.

Subject: RE: BOHRN status, publication

Hi Tigga,

Congratulations on having your piece accepted (with revisions, as always)! I would really appreciate you adding detail about BOHRN and highlighting the network's efforts. All of the positive outcomes you mention are well noted and align with our goals and objectives, which remain steadfast.

The current situation has certainly created unexpected challenges for all our work, but we're adapting, and want to ensure that we continue moving forward and position the network to pick up where it left off last summer, once things return to a more normal environment. In the meantime, we'll do what we are able virtually.

Let us know what you need to support this. Katie and I, along with our teams, recently updated a huge amount of documentation, reports, participant lists, etc. for BOHRN and other our TRNs for the incoming BTRP Director, in order to deposit it on our internal database, so it should be very easy to provide whatever you need. Just let us know how we can help.

Thanks so much!

Best,

Marty

Subject: [External Sender] BOHRN Status, publication

Dear Marty,

Rebekah Kading and I wrote a perspectives piece that is in revision for PLOS Biology. It calls for greater integration of ecologists/virologists (hmm, sounds familiar) and builds on analysis of a publication coauthor network. We conceptualized this at BORHN meetings and consider it a true BOHRN output, supporting BOHRN's message.

One of the reviewers specified some simple, but concrete actions that they would like to see in the revision. These actions closely ally with things we've begun at BOHRN (e.g., mission statement, contact lists of researchers). We would really like to be able to respond using BOHRN's infrastructure as it would be a good fit and would draw substantial attention to BOHRN and help boost the distributed membership and get us more on the map. The reviewer called for a mission statement, a list of who is doing what, and other simple things that could easily be integrated into the BOHRN website.

Currently, we refer to BOHRN in the acknowledgements, but have been reluctant to feature the network too centrally because we are unsure of its status and stability. It would be great to move forward with BOHRN featured more prominently, but we could do with some clarity of where things are heading. At minimum we need support of the website as that is where we will be directing people. Currently people can't join, or reset passwords etc, and we would need to work with someone on updates supporting these simple collations of information.

We have a bit less than a month to turn this around and get our revision in, so it would be great to hear your thoughts. I hope we can talk soon. I am now free fairly consistently between 10 am-Noon Mo-Thursday. I have other windows here and there as well.

All the best

Tigga

Subject: Update to the BPERNet Slides

Hi, everyone! We made a couple changes to the slides for tomorrow. Nothing substantive, just our approach to conducting the brief-out discussions and the order of a couple of the initial slides.

A reminder again to please be in the lobby at 0745, the bus will depart for Chulalongkorn promptly at 0800.

V/r,

Katie Leahy

Subject: BPERNet: Transportation Times and Other Useful Information (30 and 31 January 2017)

Hello, everyone! Welcome to Bangkok. On behalf of the Executive Committee (Dr. Martha Stokes and Dr. Mary Lancaster), we are so pleased that you are able to join us this week for our BPERNet planning meeting and other PMAC activities.

Please use this email as your resource for information regarding transportation, logistics, and other coordinating information for 30 January – 31 January.

30 January – BPERNet Meeting at Chulalongkorn Hospital

1. **The bus will depart from the Renaissance Hotel promptly at 0800** ; please be in the lobby for head count at 0745
2. We will provide coffee and light refreshment during the meeting; you will take lunch at one of the many canteen options at the hotel; please bring about 200 - 300 thai baht (~10 USD) for lunch

31 January – PMAC / BPERNet Field Trip

1. **The bus will depart from the Renaissance Hotel promptly at 0630** ; please be in the lobby for head count at 0615; please make sure that you are on time, as we are caravanning with a delegation from the Centara Hotel and will receive a police escort to move us quickly through traffic
2. We will provide a box breakfast for the bus ride
3. Please make sure that you dress appropriately for this field trip; we strongly suggest covered shoes and loose, comfortable clothing; in addition to this mode of dress we also suggest that you bring accompaniments for spending a day outdoors amongst bat roosts; such as:
    a. Hat
    b. Sunscreen
    c. Sunglasses
    d. Bug spray
    e. Water bottle

We will provide information regarding the Ambassador's reception at the close of tomorrow's meeting.

Again, we are so excited to have you all here. Please do not hesitate to reach out to me or Megan Hudson (copied) if you have any questions.

V/r,

Katie Leahy

Hi all,
Thank you Tigga and Rebekah for the inputs and reminders about academic calendar constraints. We'll keep this in mind when arranging meeting opportunities in the future. We've been aiming BOHRN meetings as side events at existing conferences/meetings, so may not be able to completely mitigate the issue, but we can certainly take academic calendars into account as we make plans.

Cheers,
Mary

Hi Tigga and everyone,

Yes, that is challenge for me as well. I am not involved in the Georgia meeting, but have made arrangements regarding class coverage so I could travel to Vienna if we proceed with that meeting in Nov. I also would not have been able to get away for both meetings though. January, after the semester is over, is generally better timing for me too. There was a December meeting option as well, which unfortunately for me would fall during the last week of classes so I couldn't get away for that, but if that works better for the majority of the steering committee perhaps we should reconsider it?

Kind regards,

Rebekah

Subject: RE: Draft Executive Summary and Website Materials

Hi Megan

Just trying to unpack the plans this fall, and have been reading through the Exec summary. Essentially a lot of BOHRN are going to Georgia and you propose an additional meeting in Austria a couple of months later?

I don't want to second guess what you all decided on in Canada, but is there any chance the second meeting (currently scheduled for November) could be when the fall semester is over (i.e. early-mid December through mid January)? As I'm on the WABnet Steering Committee I have committed to the Georgia meeting, but it is challenging to get release for multiple trips during the academic semester, particularly for same entities. I am probably not the only one running into this problem or similar

Thanks for your consideration,

Tigga

Hi Katie et al.,

I too strongly support the January meeting for the reasons that Jon outlined and also because my teaching is in the fall semester and it would be hard for me to attend the meeting in Doha.

I support Jon's RABEZ suggestion. In reference to our colleagues in bat conservation, we need to have the pathogen component in the title. And, we can't, from a grammatical perspective be an alliance FOR bat pathogens, rather an alliance for the study of bat pathogens.

Thanks, DeeAnn

On Jul 28, 2017 3:42 AM, "Jon Epstein" ecohealthalliance.org < Caution- > wrote:

Hi Katie,

I propose meeting at the Prince Mahidol Award Conference (PMAC) in Bangkok, late January 2018. Primarily, I think November might be slightly early for our next meeting, given that we're working through governance and committee population. Also, PMAC is a big One Health meeting that at least three of us on the steering committee will already be attending, so there's some efficiency to it in terms of scheduling and expense, as well as having thematic relevance to our group.

Potential names:

1) Bat Ecology Research Network (BERN)

2) Bat Research Coordination Network (BRCN)

3) Global Alliance for Bat Research (GABR)

4) Research Alliance for Bat-borne Emerging Zoonoses

(RABEZ)

Cheers,

Jon

Note: this email is best viewed in HTML

Greetings, GBA Steering Committee!

As promised we compiled a couple products and action items from our inaugural meeting on the 29th.

The All Partners Access Network (the site we will use for document sharing and editing) is live and the Executive Summary from our meeting, revised TORFTA, and TORFTA editing sheet have been uploaded. Here are the directions for access:

1. Go to Caution-Caution-www.apan.org < Caution-Caution-http://www.apan.org >
2. Click, "Create Account" (green button, upper right)
3. Use preferred work email and create password
4. Notify Will Sander > once you have created your account; he will invite you to join the GBA SharePoint

For your ease, I have also attached the products that were hung on APAN:

1. An Executive Summary of the 29 June meeting for your files. This lists out key discussions, action items, and participants from the meeting.
2. Revised TORFTA (v14); NOTE: the plan for this document is to open a one week editing period for comments. If possible, edits and comments are due back NLT 31 July. After that, the official Version 1 of the GBA will be published.

Here are some requests that we have of you; if you have ideas on any or all of these items, please respond to this email:

1. We need suggestions for a next meeting and would like your suggestions; we will plan to release all options to the group in one week from now for vote. Here are some suggestions to get us started:
    a. International Congress on Pathogens at the Human and Animal Interface (ICOPHAI) 7-9 November 2017, Doha, QatarCaution-Caution-https://icophai.org/ < Caution-Caution-https://icophai.org/ >
    b. Participatory Epidemiology Network for Animal and Public Health (PENAPH) - 10-12 January 2018, Chiang Mei, ThailandCaution-Caution-https://penaph.net/second-penaph-conference-participatory-approaches-in-animal-health-public-health-one-health-and-ecohealth/ < Caution-Caution-https://penaph.net/second-penaph-conference-participatory-approaches-in-animal-health-public-health-one-health-and-ecohealth/ >
    c. Others??
2. We need suggestions for Network names and would like your suggestions; we will plan to release the options to the group in one week from now for vote. Here are some suggestions to get us started:
    a. Global Alliance for Bat-borne Pathogens (GABP)
    b. Global Bat Pathogen Disease Network (GBPDN)
    c. Bat Alliance Trust Disease Network (BAT-DN)
    d. Others??
3. We need nominations for co-chairs, seek your suggestions; we will plan to release nominees in one week from now for vote.

On the off-chance that we might find something interesting which is non-viral, what about Bat-associated Pathogen and Ecology Research Network? That would yield the BPER Network or BPERN as acronyms.

My RABEZ suggestion was slightly tongue-in-cheek. In retrospect, I worry that it might be outwardly confusing to others if we become the "Rabies network" when we won't actually be doing much with rabies. With sensitivity to the bat conservation community, I suggest the "Bat Viral Ecology Research Network" or something along that line.

Cheers,
Jon

Subject: Re: GBA Products and Action Items

Hi Katie et al.,

I too strongly support the January meeting for the reasons that Jon outlined and also because my teaching is in the fall semester and it would be hard for me to attend the meeting in Doha.

I support Jon's RABEZ suggestion. In reference to our colleagues in bat conservation, we need to have the pathogen component in the title. And, we can't, from a grammatical perspective be an alliance FOR bat pathogens, rather an alliance for the study of bat pathogens.

Thanks, DeeAnn

Greetings, GBA Steering Committee!

As promised we compiled a couple products and action items from our inaugural meeting on the 29th.

The All Partners Access Network (the site we will use for document sharing and editing) is live and the Executive Summary from our meeting, revised TORFTA, and TORFTA editing sheet have been uploaded. Here are the directions for access:

1. Go to Caution-www.apan.org < Caution-http://www.apan.org >
2. Click, “Create Account” (green button, upper right)
3. Use preferred work email and create password
4. Notify Will Sander william.e.sander2.ctr@mail.mil < Caution-mailto:william.e.sander2.ctr@mail.mil > once you have created your account; he will invite you to join the GBA SharePoint

For your ease, I have also attached the products that were hung on APAN:

1. An Executive Summary of the 29 June meeting for your files. This lists out key discussions, action items, and participants from the meeting.
2. Revised TORFTA (v14); NOTE: the plan for this document is to open a one week editing period for comments. If possible, edits and comments are due back NLT 31 July. After that, the official Version 1 of the GBA will be published.

Here are some requests that we have of you; if you have ideas on any or all of these items, please respond to this email:

1. We need suggestions for a next meeting and would like your suggestions; we will plan to release all options to the group in one week from now for vote. Here are some suggestions to get us started:
    a. International Congress on Pathogens at the Human and Animal Interface (ICOPHAI) 7-9 November 2017, Doha, QatarCaution-https://icophai.org/ < Caution-https://icophai.org/ >
    b. Participatory Epidemiology Network for Animal and Public Health (PENAPH) – 10-12 January 2018, Chiang Mei, ThailandCaution-https://penaph.net/second-penaph-conference-participatory-approaches-in-animal-health-public-health-one-health-and-ecohealth/ < Caution-https://penaph.net/second-penaph-conference-participatory-approaches-in-animal-health-public-health-one-health-and-ecohealth/ >
    c. Others??
2. We need suggestions for Network names and would like your suggestions; we will plan to release the options to the group in one week from now for vote. Here are some suggestions to get us started:
    a. Global Alliance for Bat-borne Pathogens (GABP)
    b. Global Bat Pathogen Disease Network (GBPDN)
    c. Bat Alliance Trust Disease Network (BAT-DN)
    d. Others??
3. We need nominations for co-chairs, seek your suggestions; we will plan to release nominees in one week from now for vote.

Hi Tigga,
Looks like this is the link: http://www.pmaconference.mahidol.ac.th/index.php

And the dates are January 29 - February 3, 2018.

Also, thank you to those who have registered with APAN. Please also send me an e-mail with your username for APAN once it is created. That will make it easier for me to add you to the steering committee site.

Best,
Will

Greetings everyone

Jon is there a link for the Prince Mahidol Award Conference (PMAC)? And dates? I will be teaching that semester, and it can be a bit manic taking time off at the beginning, but not impossible.

For all the reasons pointed out by DeeAnn, I too like:

Research Alliance for Bat-borne Emerging Zoonoses

(RABEZ)

Best wishes

Tigga

Hi all,
If we can, we would like to meet right at 12PM today after the last morning session where the reception was last night for a picture!

We neglected to take a group photo of the Global Bat Alliance SC yesterday and would love to have us come together to do this today. Please spread the word as not everyone will check their e-mail.

Best,
Will Sander

Hi, everyone. A quick reminder on behalf of Mary and Marty:

Our meeting this morning will be held in Room 142, in the University Center for the Arts. This is thesame building where the conference will be held.

V/r,

Katie Leahy

Sent from my iPhone

On behalf of Mary Lancaster and Marty Stokes, we're excited to convene the first in-person meeting of the Steering Committee for the Global Bat Alliance.

As friendly reminders of what to expect:

- Convene on Thursday, June 29th, in room 142 of the University Center for the Arts (same building as the conference)
- Start at 9:30AM local time (room will be open by 9AM)
- Working lunch (lunch provided) - vegetarian option included
- Plan to end the meeting at 2:30PM local time

- For those of you calling in, we will get that information to you within the next day.

I have attached again our agenda as well as the Terms of Reference for Trusted Agents for your reference and review.

If you have any questions, do not hesitate to reach out to any of us in the CC line. The number below is my cell phone.

All,

Attached please find notes and action items from today's GBA planning meeting call. We will get started on some of the action items, which we will send to the group for comment. This will include a draft agenda for our 29 June meeting at Fort Collins, and the draft Terms of Reference for the Steering Committee.

We will also send out a calendar invitation for our next planning call. Please visit the following link: PollEv.com/gbaplanning and select the best date/time that works for your schedule, during the first week of June.

Thank you,
Caitlin Devaney

Kevin,

Wonderful, thanks so much.

Good call this morning, and thank you to all who were able to join. We'll send out action items and notes quickly so we can move forward on developing a clear and useful agenda for the Fort Collins meeting.

Best,

Marty

Global Bat Alliance Steering Committee | Planning Meeting Notes
0800 US EST 15 MAY 2017

ATTENDEES

- Dr. Marty Stokes (CBEP)
- Dr. Will Sander (CBEP)
- Ms. Katie Leahy (Cubic Global Defense)
- Ms. Caitlin Devaney (Cubic Global Defense)
- Dr. Ian Mendenhall (Duke-NUS)
- Dr. Vivek Kapur (Penn State University)
- Dr. Jon Epstein (EcoHealth Alliance)
- Dr. Kevin Olival (EcoHealth Alliance)

ACTION ITEMS

Task	Responsible	Due Date
Nominate additional GBA Steering Committee members	ALL	Rolling; interim status check during next planning meeting ~5-9 June
Gather information on neglected research areas (countries/ regions, specific diseases, specific areas) for GBA database	ALL	Rolling; interim status check during next planning meeting ~5-9 June
Gather and share information on other groups and projects, that may be underfunded, inactive or unconnected	ALL	Rolling; interim status check during next planning meeting ~5-9 June
Identify all stakeholders, and different categories in order to determine engagement routes, overlaps and appropriate integration mechanisms	ALL	Rolling; interim status check during next planning meeting ~5-9 June
Review and provide feedback on Draft Terms of Reference for the GBA Steering Committee	ALL	By next planning meeting ~5-9 June

AGENDA

Introductions

- Dr. Marty Stokes facilitated the introductions of all Global Bat Alliance (GBA) Steering Committee planning meeting attendees, as well as introductions for steering committee members who were unable to make the call.

Review of Global Bat Alliance Mission and Scope

- The overall goal of the GBA is to bring together people and organizations that seek to reduce the threat of infectious disease, with specific goals to:
    - Foster inter-regional collaborations with a focus on bat disease surveillance and bat ecology and migration
    - Identify and engage stakeholder community
    - Identify and address knowledge gaps through research projects and training activities
    - Identify opportunities to mitigate risks by applying knowledge gained
- The intent of the GBA is to develop sustainable capabilities within partner countries.
- Ultimately, the GBA Steering Committee will need more distributed, cross-disciplinary representation.
    - Current GBA Steering Committee members should explore current contacts and affiliations in order to start identifying these individuals. Of particular importance will be those with ties to both research and policy.

Discussion of upcoming meeting at Fort Collins in June

- Prior to the meeting, the GBA Steering Committee members should start gathering information on (1) neglected research areas, and (2) other related groups and projects, which will be collated into a database.
    - This will assist in further identifying missing information, and defining decisions that will need to be made in terms of critical research needs and next steps.

Discussion of infrastructure and organization of the network

- A formal structure for the GBA Steering Committee, such as a Terms of Reference (TOR), is important to guide activities such as: convening, oversight processes, and in order to create metrics for success.
- A TOR is also critical to allow for equitable and fair competition for funding, internal and external to the GBA Steering Committee.
- A draft TOR for the GBA Steering Committee will be sent out to the group for edits and review.
- The GBA should work to identify all stakeholders, and categories of stakeholders, and then determine how best to formalize those engagements.
    - A formal mechanism might be required to integrate the GBA with existing groups, such as a Memorandum of Understanding or Memorandum of Agreement.
- The GBA Steering Committee should be perceived solely as facilitators of building sustainable capacities. As such, the TOR should include a system of rotating membership, and a clear scope of membership.
- There could be utility in having a pure conservationist on the GBA Steering Committee.

Discussion of output and mentorship goals for the network

- Holding more meetings like the one that will occur next month in Fort Collins, but on a regional scale, could serve to identify additional key researchers, prioritize GBA efforts, and build awareness of the GBA.
- The GBA will explore convening regional meetings, and possibly linking them to other external bat meetings.
- The GBA can leverage the efforts of existing groups such as SEABRC, Bat Conservation Africa, and possibly some of the PREDICT work as well.

Next Steps

- The next planning meeting call will be at 0900 US EST during the week of 5-9 June.
- The next planning meeting call will focus on:
    - Creating an agenda for the Fort Collins meeting
    - Reviewing the current draft of the Steering Committee Terms of Reference
    - Status updates on the listed action items.

Subject: RE: [Non-DoD Source] Re: UPDATE: Global Bat Alliance Network (convened on behalf of CBEP)

All,

It looks like the best date and time for the next GBA steering committee planning call will be 7 June at 0900 U.S. EST. Please let us know if you will not be able to make this date and time. A calendar invitation will follow with call-in information.

Additionally, before the 7 June call we will send out a draft (Terms of Reference for Trusted Agents) TORFTA for your review. Please take a look at this document, and provide any feedback that you may have, as we will plan to work towards a consensus on the TORFTA during the call. We will plan to finalize the TORFTA when we meet in-person during the 29 June meeting in Fort Collins.

Subject: BPERNet: Transportation Times and Other Useful Information (30 and 31 January 2017)

Hello, everyone! Welcome to Bangkok. On behalf of the Executive Committee (Dr. Martha Stokes and Dr. Mary Lancaster), we are so pleased that you are able to join us this week for our BPERNet planning meeting and other PMAC activities.

Please use this email as your resource for information regarding transportation, logistics, and other coordinating information for 30 January – 31 January.

30 January – BPERNet Meeting at Chulalongkorn Hospital

1. **The bus will depart from the Renaissance Hotel promptly at 0800** ; please be in the lobby for head count at 0745
2. We will provide coffee and light refreshment during the meeting; you will take lunch at one of the many canteen options at the hotel; please bring about 200 - 300 thai baht (~10 USD) for lunch

31 January – PMAC / BPERNet Field Trip

1. **The bus will depart from the Renaissance Hotel promptly at 0630** ; please be in the lobby for head count at 0615; please make sure that you are on time, as we are caravanning with a delegation from the Centara Hotel and will receive a police escort to move us quickly through traffic
2. We will provide a box breakfast for the bus ride
3. Please make sure that you dress appropriately for this field trip; we strongly suggest covered shoes and loose, comfortable clothing; in addition to this mode of dress we also suggest that you bring accompaniments for spending a day outdoors amongst bat roosts; such as:
    a. Hat
    b. Sunscreen
    c. Sunglasses
    d. Bug spray
    e. Water bottle

We will provide information regarding the Ambassador's reception at the close of tomorrow's meeting.

Again, we are so excited to have you all here. Please do not hesitate to reach out to me or Megan Hudson (copied) if you have any questions.

V/r,

Katie Leahy

Subject: BPERNet: Transportation Times and Other Useful Information (30 and 31 January 2017)

Hello, everyone! Welcome to Bangkok. On behalf of the Executive Committee (Dr. Martha Stokes and Dr. Mary Lancaster), we are so pleased that you are able to join us this week for our BPERNet planning meeting and other PMAC activities.

Please use this email as your resource for information regarding transportation, logistics, and other coordinating information for 30 January – 31 January.

30 January – BPERNet Meeting at Chulalongkorn Hospital

1. **The bus will depart from the Renaissance Hotel promptly at 0800** ; please be in the lobby for head count at 0745
2. We will provide coffee and light refreshment during the meeting; you will take lunch at one of the many canteen options at the hotel; please bring about 200 - 300 thai baht (~10 USD) for lunch

31 January – PMAC / BPERNet Field Trip

1. **The bus will depart from the Renaissance Hotel promptly at 0630** ; please be in the lobby for head count at 0615; please make sure that you are on time, as we are caravanning with a delegation from the Centara Hotel and will receive a police escort to move us quickly through traffic
2. We will provide a box breakfast for the bus ride
3. Please make sure that you dress appropriately for this field trip; we strongly suggest covered shoes and loose, comfortable clothing; in addition to this mode of dress we also suggest that you bring accompaniments for spending a day outdoors amongst bat roosts; such as:
    a. Hat
    b. Sunscreen
    c. Sunglasses
    d. Bug spray
    e. Water bottle

We will provide information regarding the Ambassador's reception at the close of tomorrow's meeting.

Again, we are so excited to have you all here. Please do not hesitate to reach out to me or Megan Hudson (copied) if you have any questions.

V/r,

Katie Leahy

On Sep 14, 2020, at 12:30 PM, Kading,Rebekah wrote:

Dear BOHRN colleagues,

Oh my goodness, what a year it has been! We hope this message finds you all healthy and safe. While the pandemic has taken many of us on various detours from our usual routine and research over the past six months, we all have been very busy responding to this pandemic in myriad ways. In many cases, BOHRN network members have found ourselves working together on various initiatives, which has been exciting. We are looking forward to the time when we can interact in person again at conferences and at future BOHRN meetings. Thank you SO MUCH for all your efforts during this challenging time!

Tigga and I are writing to you today with a BOHRN-related update and a **specific action request to participate in a BOHRN membership directory (more details below)**.

The context: One of the positive outcomes of months of quarantine in Texas (Tigga) and Colorado (Rebekah) -- is that we followed up in a tangible way on one of the key challenges identified during our BORHN meetings: addressing the polarization of the bat ecology and infectious disease research communities. We have written a Perspectives piece, currently in review at PLOS Biology, which reports the results of a bibliometric analysis of co-author relationships among bat researchers between 1950 and 2019. This analysis identified a division between ecology- and infectious disease disciplines from the perspective of co-authored interdisciplinary journal articles (no surprise there!). However, our fields have done a good job at converging over issues that have presented a common mission, such as white nose syndrome. SARS-CoV-2 has provided a similar common ground for us to rally around as far as the risk this virus poses to both human and bat health. The editors and reviewers have challenged us to take steps that will actually lead to productive outcomes and interdisciplinary collaborations. Hence, we are very excited to engage directly with BOHRN and build on the infrastructure that has already been put into place by DTRA-BTRP.

Action item: In the immediate-term, **our goal is build a searchable membership directory housed within the BOHRN website.** This will enable members to connect with each other, learn more about what others are doing, and recruit people to the various working groups that BOHRN has established. DTRA and Global Systems Engineering have graciously and expeditiously revamped the website to enable this specific functionality. **How this works**: interested stakeholders will set up a member login on the BOHRN website as well as a member profile that will be visible to other members after logging in. **Members will benefit** from being able to search the directory for colleagues in complementary research areas, and receive information disseminated by BOHRN regarding opportunities and meetings. All of the information you enter will be accessible only to other members.

Steps we're asking you to take:

1. Go to https://www.bohrn.net
2. Click on "Join"
3. Create an account, fill out your profile
4. Check the boxes to affirm that you agree with having your information visible to others within the member page, and with the BOHRN mission statement (provided)
5. Click "Continue" to be brought to the Members page.
6. Your profile will automatically be entered into the directory, butthis may take a few hours to sync and be visible on the website.
7. From the Members page you should be able to view other member profiles as well as search the directory.

Thanks so much, and please don't hesitate to reach out to us if you have any questions. We look forward staying in contact and growing the BOHRN network together.

Kind regards,

Rebekah and Tigga

Subject: Re: BOHRN Meeting Agenda and Materials 20 - 21 June

Dear Megan Hudson
I pray that all in the mailing list are in good health.
Today was a public holiday in Uganda (and I think all of East Africa and beyond). By close of business yesterday the information I had from the Canadian Embassy (Tanzania office where Visas for Ugandan applicants are processed) was that my Visa was "being processed@. Therefore I don't have have one yet.
My last hope is that I get back my passport on Monday from Tanzania with a visa. I requested that my travel plans be moved to the 19th June therefore. If the Visa comes through, I will only be able to arrive in Canada late on the 20th and therefore will be unable to attend business on the 20th June. I shall fill the ResearchQuard and return it in the hope that I shall make the trip and therefore be able to talk about it on the 21st if the schedule will permit for this.
I shall give an update on Monday if I receive back my passport from Dar-er salaam with the Visa.
Best regards
Robert Kityo

Dear Marty
Thanks for the speedy response and support! Great to hear of the documentation efforts and continued commitment.

The lynchpin to everything that we'd like to do is the BOHRN website – is there a webmaster, or can one be allocated, so that we can host content, build membership, post some of the materials that have been developed.

Best
Tigga

Subject: RE: BOHRN Status, publication

Hi Tigga,

Congratulations on having your piece accepted (with revisions, as always)! I would really appreciate you adding detail about BOHRN and highlighting the network's efforts. All of the positive outcomes you mention are well noted and align with our goals and objectives, which remain steadfast.

The current situation has certainly created unexpected challenges for all our work, but we're adapting, and want to ensure that we continue moving forward and position the network to pick up where it left off last summer, once things return to a more normal environment. In the meantime, we'll do what we are able virtually.

Let us know what you need to support this. Katie and I, along with our teams, recently updated a huge amount of documentation, reports, participant lists, etc. for BOHRN and other our TRNs for the incoming BTRP Director, in order to deposit it on our internal database, so it should be very easy to provide whatever you need. Just let us know how we can help.

Thanks so much!

Best,
Marty

Subject: [External Sender] BOHRN Status, publication

Dear Marty,

Rebekah Kading and I wrote a perspectives piece that is in revision for PLOS Biology. It calls for greater integration of ecologists/virologists (hmm, sounds familiar) and builds on analysis of a publication coauthor network. We conceptualized this at

BORHN meetings and consider it a true BOHRN output, supporting BOHRN's message.

One of the reviewers specified some simple, but concrete actions that they would like to see in the revision. These actions closely ally with things we've begun at BOHRN (e.g., mission statement, contact lists of researchers). We would really like to be able to respond using BOHRN's infrastructure as it would be a good fit and would draw substantial attention to BOHRN and help boost the distributed membership and get us more on the map. The reviewer called for a mission statement, a list of who is doing what, and other simple things that could easily be integrated into the BOHRN website.

Currently, we refer to BOHRN in the acknowledgements, but have been reluctant to feature the network too centrally because we are unsure of its status and stability. It would be great to move forward with BOHRN featured more prominently, but we could do with some clarity of where things are heading. At minimum we need support of the website as that is where we will be directing people. Currently people can't join, or reset passwords etc, and we would need to work with someone on updates supporting these simple collations of information.

We have a bit less than a month to turn this around and get our revision in, so it would be great to hear your thoughts. I hope we can talk soon. I am now free fairly consistently between 10 am-Noon Mo-Thursday. I have other windows here and there as well.

All the best

Dear BOHRN Steering Committee Members,
As part of our poliolab@ncdc.ge Marty and Katie would like us to discuss data curation and data standardization for BOHRN projects. The plan is to begin the discussion during the SC meeting, and then have a broader discussion, on day three, with the full group. On Sunday, Noam Ross from EHA will present some specific ideas around data standardization to kick start the discussion, focusing on how we might approach developing a common database or data collection standard that can be used across BOHRN projects to facilitate broader analyses. Noam works with Kevin on the PREDICT Modeling & Analytics team and has substantial experience with data management and curation.

We'll also discuss whether and how we might want to make existing datasets available to the BOHRN network, to create opportunities for scientists to leverage them to develop new projects or perform new analyses. For this part, Marty has requested that we come prepared with a list or description of datasets, (e.g. those already published) that we have in hand that could be made available to the BOHRN network.

If you have any questions, don't hesitate to reach out to Katie Leahy Marty, or me. I look forward to seeing you all in Phuket soon.

Safe travels.

Cheers,
Jon

All,

You are receiving this email, as part of a save the date to attend our BOHRN Steering Committee meeting and the 5th International One Health Congress (OHC) in Saskatoon, Canada.

Our meeting will take place on 20-21 June (location TBD, though likely at the Hilton Garden Inn). The agenda and travel information for this two day event will follow shortly. The OHC will take place 22-25 June.

On behalf of Dr. Marty Stoke and Dr. Mary Lancaster, CBEP will provide funding your travel and registration to the OHC and BOHRN Planning Meeting. While the OHC is not required it would be a good opportunity for networking on behalf of BOHRN. CBEP will be paying for OHC attendance next week. **Therefore, we need you to confirm your attendance to the OHC NLT tomorrow 23 March.** However, please note if regulations for DoD travel are not met by the specified due date, funding for the conference and travel will not be provided.

Please respond with your availability to attend the meeting NLT 23 March.

v/r,

Megan

Subject: BOHRN Steering Committee/One Health Congress Meeting

All,

You are receiving this email, as part of a save the date to attend our BOHRN Steering Committee meeting and the 5th International One Health Congress (OHC) in Saskatoon, Canada.

Our meeting will take place on 20-21 June (location TBD, though likely at the Hilton Garden Inn). The agenda and travel information for this two day event will follow shortly. The OHC will take place 22-25 June.

On behalf of Dr. Marty Stoke and Dr. Mary Lancaster, CBEP will provide funding your travel and registration to the OHC and BOHRN Planning Meeting. While the OHC is not required it would be a good opportunity for networking on behalf of BOHRN. CBEP will be paying for OHC attendance next week. **Therefore, we need you to confirm your attendance to the OHC NLT tomorrow 23 March.** However, please note if regulations for DoD travel are not met by the specified due date, funding for the conference and travel will not be provided.

Please respond with your availability to attend the meeting NLT 23 March.

v/r,

Megan

This guide has all the information you will need for the workshop (objectives, agenda, and logistics instructions). We have additionally included strategy maps that outline the four major research interest areas of BOHRN, which were developed during three strategy mapping sessions prior to this workshop. Also attached to this email you will find a series of slides that provide a visual accompaniment for the research areas described in the participant guide. This will be explained more in-depth during the workshop; however, it should give you a good idea about the scope and bounds of the network.

All,

Please find the draft report from our meeting last week. This report includes an executive summary, action items, participant list, working group outcomes, lessons learned from your feedback, and the original slides from the end-of-day brief-out.

We ask that you provide constructive comments (e.g., content changes) no later than 20 February 2018. It is our intent to adjudicate and incorporate any comments with Mary and Marty and then publish a final report on 22 February 2018.

Also, thank you, to everyone who provided feedback via the survey monkey poll. We will be incorporating all of your comments into our meetings going forward.

Dear Katie and all,
On January 31, 2018 there will be a PMAC field trip, and one of PREDICT study at site at Chonburi province is selected by Ministry of Public Health for one of 6 visit sites. This is a concurrent site where PREDICT Thailand team has been conducting a longitudinally survrillance on bat and human.
If you are invited by PMAC, please kindly consider to visit this site, it will be posted on the website for selection very soon (site 4) and the number of guests are limited for 40.

I could not attend the steering committee meeting on Jan 31.
Anyway I'm happy to help for organizing the place for the meeting, at Chula hospital! (free of charge).

Best,
Supaporn

Subject: BPERNet Update and Meeting Date

Dear BPERNet Steering Committee Members,

After careful consideration of the size and scope of PENAPH and increased travel and schedule concerns from BPERNet members, CBEP has decided to move the date of our second meeting to coordinate with the Prince Mahidol Award Conference (PMAC) 2018 in Bangkok, Thailand. We will hold our meeting on Wednesday, 31 January. We have yet to set a time or location, but anticipate that travel planning should support a full day meeting.

Most of PMAC's objectives are focused on zoonoses and some complement BPERNet's ecological focus, this will assist members of the group who plan to attend the conference and use it as an opportunity to advertise our network. I am attaching PMAC information for everyone's situational awareness.
Please consider this email an official a save the date on behalf of CBEP, with more information to follow, which will include travel, agenda, time, and location information. At your earliest convenience, please let me know if you can support attending this meeting.

Thanks!

V/r,

Katie Leahy

Subject: CBEP Global Bat Alliance meeting
When: Thursday, February 9, 2017 1:30 PM-2:30 PM (UTC-05:00) Eastern Time (US & Canada).
Where: Hilton Alexandria Mark Center; exact location TBD

Update: We will meet in the Foyer area at 1:30PM and move to a different location from there.

CBEP would like to convene researchers from all CBEP-engaged regions to discuss formation of a Global Bat Alliance (GBA). The GBA will aim to build and leverage country and regional capabilities to generate an enhanced understanding of bats and their ecology within the context of pathogens of security concern. This meeting will serve to discuss future collaborative efforts of the Global Bat Alliance.

Hi Rebekah,

Great to hear from you, and I hope you are doing well too! I would be happy to chat with Anne about the available positions at EHA, please pass my email to her and we can set up a time to chat. I did a quick search of Anne, and besides being an amazing scientist that I think would be a great fit at EHA, I noticed she completed her undergrad in Iowa (which is also my home state).

In terms of BOHRN initiatives, if I can contribute in any way please feel free to contact me. I often get overlooked with both Jon and Kevin being BOHRN members.

Cheers,
Kendra

Agreed, great job Kevin and Paul for the quick turnaround.

The CNN special can be viewed on www.cnn.com/go, click on "Shows" to the left-side of the screen and the special should be an option at the top of the screen (or one scroll to the right). I think you need a cable subscription to log-in to view though.

-CoV-2 spillover risk to North American bats manuscript - FINAL version for PLOS Pathogens (new plan)

Dear all,

Update on our ms. It was submitted to PLOS Pathogens on June 2nd (you should have all received an email from the journal confirming this) and it is currently under review.

We are in the final stages of USGS approval to also submit to bioRxiv (pre-print server), and expect to finalize that and post it on bioRxiv in the next 24 hours. *Please let me know if there are any objections.*

Cheers,
Kevin

Thank you all for the last round of invaluable edits and comments. Paul and I have now gone through multiple revisions since you last saw the paper in an attempt to include everyone's feedback; so apologize for the delay in turning this around and moving towards submission.
> >
> > We started a submission to *Lancet Infectious Diseases*, but after thinking more about the journal's scope and reading other recent reviews that have been published in the journal, Paul and I decided it was not the best fit after all. We instead plan to submit this as a Perspectives article to *PNAS*(https://www.pnas.org/page/authors/purpose-scope). We think *PNAS* is a better fit all around, especially given the US focus of our review. We are currently following up some leads for "sponsorship" of our paper with PNAS which would make it an invited piece. If you have any specific suggestions in this regard, please let me know.
> >
> > As before, the plan is once we submit (hopefully this week) to *PNAS* we will also post as a pre-print on BioRxiv so it can be viewed and used immediately. **If there are any objections to this plan or to submit to *PNAS*, please let me know.**
> > Also, for those that have secured USG approval already, please let me know if these needs to be updated or if you need any more information.

This has been a fantastic exercise in group writing! Big thank you to everyone.

Cheers,
Kevin

Hi Rebekah,

I look forward to talking with Anna.

What a small world, I have a lot of family that lives near Adair and I know the exact water tower you are talking about! I typically spend March - October in Western Asia for fieldwork, but find myself stuck in NYC instead this year and have been yearning to travel back to Iowa to visit my family. And honestly to smell fresh air and eat Casey's pizza (only people from the Midwest understand that the best pizza comes from a convenience store….NYC pizza has nothing on Casey's pizza:). Enjoy your time in Iowa, and safe travels.

Hi Kendra,

Great - thanks so much! I'll send Anna your way. Yes, I agree that EHA may be a great fit for her, and she is thrilled there are open positions! And the Iowa connection. We talk Iowa a lot because my husband's family farms in Iowa....right along I-80 between Omaha and DesMoines, by the yellow smiley face water tower at the Adair/Casey exit...we're headed there next week actually. Small world! I'll definitely loop you in about anything with BOHRN that you could contribute to - I appreciated all your input at the Vienna meeting and it would be great to have you involved. We had a lot of momentum after that meeting but they've been very quiet lately....DTRA seems to be going through some restructuring. But if things calm down by this fall I think they will try to have another meeting and get things going again.

Thanks!

Quick update on our paper — unfortunately got news yesterday that *PNAS* was not interested in this as a Perspectives piece, and rejected our proposal. We are currently pursuing options with editors at *PLOS Pathogens* to see if they want it as a review. Will keep you all posted.

Latest version attached that has cleared CDC and USGS review. We will still aim to get this on BioRxiv, but wanted to wait until we had it cleared first and ideally in review at a journal.

Cheers,
Kevin

Dear Co-authors,

Attached is the latest, submission ready version of our paper "**Possible risks of SARS-CoV-2 spillover to free-ranging wildlife: a case study of bats**". Thank you all for the last round of invaluable edits and comments. Paul and I have now gone through multiple revisions since you last saw the paper in an attempt to include everyone's feedback; so apologize for the delay in turning this around and moving towards submission.

We started a submission to *Lancet Infectious Diseases*, but after thinking more about the journal's scope and reading other recent reviews that have been published in the journal, Paul and I decided it was not the best fit after all. We instead plan to submit this as a Perspectives article to *PNAS*(https://www.pnas.org/page/authors/purpose-scope). We think *PNAS* is a better fit all around, especially given the US focus of our review. We are currently following up some leads for "sponsorship" of our paper with PNAS which would make it an invited piece. If you have any specific suggestions in this regard, please let me know.

As before, the plan is once we submit (hopefully this week) to *PNAS* we will also post as a pre-print on BioRxiv so it can be viewed and used immediately. **If there are any objections to this plan or to submit to *PNAS*, please let me know.**
Also, for those that have secured USG approval already, please let me know if these needs to be updated or if you need any more information.

This has been a fantastic exercise in group writing! Big thank you to everyone.

Cheers,
Kevin

Subject: RE: CREID Biorepository Oversight and Quality Working Group

Hello Biorepository WG members,

We are looking forward to our **first full working group meeting next Tuesday, October 27th**! In preparation, we have posted a Pre-Survey Information excel document on Teams as an early tool to help brainstorm and guide what information we may need to collect via the surveys for the inventory.

Please have the primary and/or secondary representative populate information for your center. Feel free to use CREATE-NEO's row as an example, and we welcome additional feedback on the document.

Thank you,

Nefer
Project Coordinator, CREID Coordinating Center

Subject: RE: Draft Executive Summary and Website Materials

Hi Megan
Just trying to unpack the plans this fall, and have been reading through the Exec summary. Essentially a lot of BOHRN are going to Georgia and you propose an additional meeting in Austria a couple of months later?

I don't want to second guess what you all decided on in Canada, but is there any chance the second meeting (currently scheduled for November) could be when the fall semester is over (i.e. early-mid December through mid January)? As I'm on the WABnet Steering Committee I have committed to the Georgia meeting, but it is challenging to get release for multiple trips during the academic semester, particularly for same entities. I am probably not the only one running into this problem or similar

Thanks for your consideration,
Tigga

Subject: Draft Executive Summary and Website Materials

All,

Please find the draft report from our BOHRN meeting 20-21 June. This report includes an executive summary, action items, participant list, working group outcomes, and your research quad charts.

We ask that you provide constructive comments (e.g., content changes) no later than 18 July. It is our intent to adjudicate and incorporate any comments to then publish a final report.

In addition, you will find an updated version of the website map here (https://docs.google.com/document/d/1x5GdAKEPpKXTol9utZiYvaGoXNtOQsyTdlub1WvN0tk/edit?usp=sharing). Each page has the title of the website page and the content, make edits, as you see fit, to the language to help us better develop the website.

As a reminder, we will be adding individual bios to the website. If you have not already done so, you may submit your information here: https://www.surveymonkey.com/r/BPMTG2T

You will find the report contains softened language to add a more conservationist view point, please review the language within the report and on the website.

v/r,

Megan

Hi Meghan
As three of the ecologists could not make it, I think group 3 needs more time to confer remotely than the deadline of the 18th allows. Please give us until at least the end of July. I am I in the field with only intermittent internet as well.

Thanks
Tigga

If Kevin and Paul can get together an eclectic group such as this one, perhaps they should be put in charge of the United Nations or the U.S. Congress (for starters).

Dear Dr. Olival,
We are pleased to inform you that your manuscript 'Title - Possibility for reverse zoonotic transmission of SARS-CoV-2 to free-ranging wildlife: a case study of bats

Short Title - Possibility for SARS-CoV-2 transmission from humans to free-ranging bats' has been provisionally accepted for publication in PLOS Pathogens.
Before your manuscript can be formally accepted you will need to complete some formatting changes, which you will receive in a follow up email. A member of our team will be in touch with a set of requests.
Please note that your manuscript will not be scheduled for publication until you have made the required changes, so a swift response is appreciated.
IMPORTANT: The editorial review process is now complete. PLOS will only permit corrections to spelling, formatting or significant scientific errors from this point onwards. Requests for major changes, or any which affect the scientific understanding of your work, will cause delays to the publication date of your manuscript.
Should you, your institution's press office or the journal office choose to press release your paper, you will automatically be opted out of early publication. We ask that you notify us now if you or your institution is planning to press release the article. All press must be co-ordinated with PLOS.
Thank you again for supporting Open Access publishing; we are looking forward to publishing your work in PLOS Pathogens.
Best regards,

Seema Lakdawala, PhD

Dear Dr. Olival,
We are pleased to inform you that your manuscript 'Title - Possibility for reverse zoonotic transmission of SARS-CoV-2 to free-ranging wildlife: a case study of bats

Short Title - Possibility for SARS-CoV-2 transmission from humans to free-ranging bats' has been provisionally accepted for publication in PLOS Pathogens.
Before your manuscript can be formally accepted you will need to complete some formatting changes, which you will receive in a follow up email. A member of our team will be in touch with a set of requests.
Please note that your manuscript will not be scheduled for publication until you have made the required changes, so a swift response is appreciated.
IMPORTANT: The editorial review process is now complete. PLOS will only permit corrections to spelling, formatting or significant scientific errors from this point onwards. Requests for major changes, or any which affect the scientific understanding of your work, will cause delays to the publication date of your manuscript.
Should you, your institution's press office or the journal office choose to press release your paper, you will automatically be opted out of early publication. We ask that you notify us now if you or your institution is planning to press release the article. All press must be co-ordinated with PLOS.
Thank you again for supporting Open Access publishing; we are looking forward to publishing your work in PLOS Pathogens.
Best regards,

Seema Lakdawala, PhD

Great discussion! Thanks for forwarding the paper Jon, and thanks for summarizing the data Dan.
Receptor binding studies are a great and practical first step, however, susceptibility is far more complex than receptor binding. Many processes must be overcome to infect a new species and experiments are probably the only way to definitively determine susceptibility.
I reached out to Tony S to see if he had insights about Artibeus jamaicensis (susceptible) with respect to the AA considered in the paper – he looked through his transcriptome data and noted it has 13 matched AAs.
I look forward to more discussion tomorrow.

Subject: Re: Expert judgement for SARS-CoV-2 risk assessment for North American bats

Hi Jon,

Thanks for passing this along. So others don't have to dig through all of the the 2.5 page table full of abbreviations, here are some scores (matching residues of the 20 key AAs considered) for a few selected species which might be relevant to judging the susceptibility of Myotis lucifugus, which had a score of 11/20:

Homo sapiens (20/20)
Sus scrofa (15/20), in vitro evidence of infection
Mustela putorius furo (15/20), in vivo susceptibility confirmed
Rhinolophus macrotis (13/20), susceptible?
Rhinolophus pusillus (14/20), susceptible?
Rhinolophus ferrumequinum (12/20), susceptible?
Desmodus rotundus (12/20), possibly susceptible (same family as Artibeus, which was not included in the study)?

So, Myotis is relatively low on the list, but so are bats which are related to the presumed reservoir and known susceptible species like ferrets are not too much higher up on the list. I'd be curious to know how others with more knowledge than myself interpret these numbers. Is this measure of ACE-2 affinity something we should use and how low is too low for a host to be susceptible?

Best,
Daniel

Abstract

Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) causes the recent COVID-19 public health crisis. Bat is the widely believed original host of SARS-CoV-2. However, its intermediate host before transmitting to humans is not clear. Some studies proposed pangolin, snake, or turtle as the intermediate hosts. Angiotensin-converting enzyme 2 (ACE2) is the receptor for SARS-CoV-2, which determines the potential host range for SARS-CoV-2. On the basis of structural information of the complex of human ACE2 and SARS-CoV-2 receptor-binding domain (RBD), we analyzed the affinity to S protein of the 20 key residues in ACE2 from mammal, bird, turtle, and snake. Several ACE2 proteins from *Primates*, *Bovidae*, *Cricetidae*, and *Cetacea* maintained the majority of key residues in ACE2 for associating with SARS-CoV-2 RBD. The simulated structures indicated that ACE2 proteins from *Bovidae* and *Cricetidae* were able to associate with SARS-CoV-2 RBD. We found that nearly half of the key residues in turtle, snake, and bird were changed. The simulated structures showed several key contacts with SARS-CoV-2 RBD in turtle and snake ACE2 were abolished. This study demonstrated that neither snake nor turtle was the intermediate hosts for SARS-CoV-2, which further reinforced the concept that the reptiles are resistant against infection of coronavirus. This study suggested that *Bovidae* and *Cricetidae* should be included in the screening of intermediate hosts for SARS-CoV-2.

KEYWORDS

ACE2, *Bovidae*, *Cricetidae*, intermediate host, SARS-CoV-2

1 | INTRODUCTION

Coronavirus disease 2019 (COVID-19), which was first reported in Wuhan, Hubei province, China, has caused over 80 422 human infections and more than 2984 deaths (as of 4 March 2020) in China.[1,2] The confirmed cases outside China are increasing, which raised major global concern. Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) was identified to be the pathogen of COVID-19. SARS-CoV-2 has joined SARS-CoV and Middle East respiratory syndrome-related coronavirus (MERS-CoV) as another coronavirus that causes severe respiratory disease and human death.[3,4]

The specificity of the interaction between virus and receptor determines its host range for the virus. Spike protein (S) of SARS-CoV-2 has attracted great attention because of its role in receptor binding. Angiotensin-converting enzyme 2 (ACE2) binds to the receptor-binding domain (RBD) of SARS-CoV-2 S protein and functions as a receptor for SARS-CoV-2.[5,6] The origin of SARS-CoV-2 is considered as bat.[6] However, the intermediate host is unknown. Some studies suggest that pangolin is involved in the evolution of SARS-CoV-2.[7,8] Others suggested that snake and turtles are potential intermediate hosts for SARS-CoV-2.[9,10] In this study, we compared the key amino acids (AAs) in ACE2 from different species for the binding ability to RBD. On the basis of

potential interaction between S protein and ACE2, it was speculated that SARS-CoV-2 preserved the ability to infect *Bovidae* and *Cricetidae* but not snake or turtle.

2 | METHODS

2.1 | Sequence analysis of ACE2

A total of 93 ACE2 protein sequences were selected from 85 mammals, 4 birds, 3 turtles, and 1 snake. These ACEs with their corresponding species are listed as follows: hACE2: *Homo sapiens* (BAB40370.1), RhiACE2: *Rhinopithecus roxellana* (XP_010364367.2), MacmACE2: *Macaca mulatta* (NP_001129168.1), MuseACE2: *Mustela erminea* (XP_032187679.1), CamdACE2: *Camelus dromedarius* (XP_031301717.1), PlACE2: *Procyon lotor* (XP_031301717.1), PcACE2: *Paguma larvata* (AAX63775.1), RmACE2: *Rhinolophus macrotis* (ADN93471.1), RfACE2: *Rhinolophus ferrumequinum* (BAH02663.1), RsACE2: *Rhinolophus sinicus* (ADN93472.1), RlACE2: *Rousettus leschenaultii* (BAF50705.1), SsACE2: *Sus scrofa* (NP_001116542.1), MpfACE2: *Mustela putorius furo* (BAE53380.1), RatACE2: *Rattus norvegicus* (Q5EGZ1), MmACE2: *Mus musculus* (Q3URC9), ClfACE2: *Canis lupus familiaris* (J9P7Y2), FcACE2: *Felis catus* (A0A384DV19), MjACE2: *Manis javanica* (XP_017505752.1), RpACE2: *Rhinolophus pearsonii* (ABU54053.1), PvACE2: *Pteropus vampyrus* (XP_011361275.1), PoaACE2: *Pongo abelii* (NP_001124604.1), EcACE2: *Equus caballus* (F6V9L3), BtACE2: *Bos taurus* (Q58DD0), PtACE2: *Pan troglodytes* (A0A2J8KU96), OraACE2: *Ornithorhynchus anatinus* (F7FDA2), OvaACE2: *Ovis aries* (W5PSB6), PanACE2: *Papio Anubis* (A0A096N4X9), LaACE2: *Loxodonta africana* (G3T6Q2), SsdACE2: *Sus scrofa domesticus* (A0A220QT48), EeACE2: *Erinaceus europaeus* (A0A1S3APE5), OcACE2: *Oryctolagus cuniculus* (G1TEF4), NpACE2: *Nyctereutes procyonoides* (B4XEP4), VvACE2: *Vulpes vulpes* (A0A3Q7RAT9), PhcACE2: *Phodopus campbelli* (C7ECU7), MaACE2: *Mesocricetus auratus* (C7ECV1), CjACE2: *Callithrix jacchus* (F7CNJ6), SusACE2: *Suricata suricatta* (XP_029786256.1), HgACE2: *Heterocephalus glaber* (A0A0N8EUX7), DoACE2: *Dipodomys ordii* (A0A1S3GHT7), ItACE2: *Ictidomys tridecemlineatus* (XP_005316051.3), CpACE2: *Cavia porcellus* (XP_023417808.1), CgACE2: *Cricetulus griseus* (A0A061HZ66), ChACE2: *Capra hircus*(A0A452EVJ5); BibtACE2: *Bos indicus x Bos taurus* (A0A4W2H3A1), BmACE2: *Bos mutus* (L8I4I4), NlACE2: *Nomascus leucogenys* (G1RE79); CsACE2: *Chlorocebus sabaeus* (A0A0D9RQZ0); MfACE2: *Macaca fascicularis* (A0A2K5X283); PpACE2: *Pan paniscus* (A0A2R9BKD8); CaACE2: *Cercocebus atys* (A0A2K5KSD8); MnACE2: *Macaca nemestrina* (A0A2K6D1N8); MalACE2: *Mandrillus leucophaeus* (A0A2K5ZV99); TsACE2: *Tarsius syrichta* (A0A1U7TY97); PrcACE2: *Propithecus coquereli* (A0A2K6GHW5); UmACE2: *Ursus maritimus* (A0A452TT30); OgACE2: *Otolemur garnettii* (H0WMI5); SbbACE2: *Saimiri boliviensis boliviensis* (A0A2K6SBD4); CciACE2: *Cebus capucinus imitator* (A0A2K5PYM0); GggACE2: *Gorilla gorillagorilla* (G3QWX4); AnACE2: *Aotus nancymaae* (A0A2K5DQI6); ChaACE2: *Chlorocebus aethiops* (Q1LZX8); AmACE2: *Ailuropoda melanoleuca* (G1MC42); VuACE2: *Vombatus ursinus* (A0A4X2M679); UaACE2: *Ursus americanus* (A0A452R1Z9); UahACE2: *Ursusarctos horribilis* (A0A3Q7TE16); PmACE2: *Physeter macrocephalus* (A0A2Y9S5T9); LvACE2: *Lipotes vexillifer* (A0A340Y3Y6); BasACE2: *Balaenoptera acutorostrata scammoni* (A0A452CBT6); DlACE2: *Delphinapterus leucas* (A0A2Y9M9H3); TtACE2: *Tursiops truncatus* (A0A2U4AJL3); NaaACE2: *Neophocaena asiaeorientalis asiaeorientalis* (A0A341BCI8); CuACE2: *Callorhinus ursinus* (A0A3Q7N3M7); NsACE2: *Neomonachus schauinslandi* (A0A2Y9GEI9); TmlACE2: *Trichechus manatuslatirostris* (A0A2Y9E393); ElkACE2: *Enhydra lutriskenyoni* (A0A2Y9KLV0); ClACE2: *Chinchilla lanigera* (C7ECU0); MdACE2: *Monodelphis domestica* (F6WXR7); LpACE2: *Lynx pardinus* (A0A485NF12); PaACE2: *Pipistrellus abramus* (C7ECT9); MbACE2: *Myotis brandtii* (S7N573); DrACE2: *Desmodus rotundus* (K9INV8); RhpACE2: *Rhinolophus pusillus* (E2DHI9); RaACE2: *Rhinolophus alcyone* (A0A0N7IQX6); RlACE2(2): *Rhinolophus landeri* (A0A0P0IB69); MylACE2: *Myotis lucifugus* (G1PXH7), GgACE2: *Gallus gallus* (F1NHR4), ApACE2: *Anas platyrhynchos* (R0LHX5), MgACE2: *Meleagris gallopavo* (G1NPB8), CaaACE2: *Cathartes aura* (A0A091MDI4), OhACE2: *Ophiophagus hannah* (V8NIH2), CpbACE2: *Chrysemys picta bellii* (XP_023964517.1), CmACE2: *Chelonia mydas* (XP_007070561.1); and PsACE2: *Pelodiscus sinensis* (XP_006122891.1). On the basis of known 20 key sites in human ACE2 interacting with SARS-CoV-2 RBD,[11] we analyzed whether these sites were conserved on other ACE2 proteins. Phylogenetic and molecular evolutionary analysis of ACE2 protein was conducted using molecular evolutionary genetics analysis version X (MEGA-X).[12] Phylogenetic tree was generated with Jones-Taylor-Thornton evolutionary model using a maximum-likelihood method.

2.2 | Structure simulation of ACE2-RBD complex

On the basis of the structure of hACE2 with SARS-CoV-2 S RBD (PDB: 6LZG), the structure of SARS-CoV-2 S and ACE2 from *Bos taurus*, *Cricetulus griseus*, *Pelodiscus sinensis*, and *Ophiophagus hannah* were simulated by SWISS-MODEL online server[13] and analyzed by Chimera software version 1.14.[14]

3 | RESULTS

3.1 | Sequence alignment of ACE2

According to the recently resolved structure of the complex of human ACE2 and SARS-CoV-2 RBD, there are 20 key AAs in hACE2 for interacting with RBM.[11] We analyzed those AAs of ACE2 protein from a list of mammals, birds, turtles, and snake, as shown in Table 1. Next, a phylogenetic tree for mammalian ACE2 proteins was constructed by MEGA-X software. There were 16 *primates* ACE2, 5 *Bovidae* ACE2, 2 *Cricetidae* ACE2, and 3 *Cetacea* ACE2 (Table 1 and Figure 1A), possessing at least 90% (18/20) critical AAs. Pangolin ACE2 preserved only 70% (14/20) AAs. Nearly half of the key residues in turtles (CpbACE2, CmACE2, and PsACE2) and snake (OhACE2) were changed (Table 1). ACE2 from *Aves*, including *Gallus gallus*, *Anas platyrhynchos*, *Meleagris gallopavo*, and *Cathartes aura*, only matched 10 to 11 AAs (Table 1).

ACE2, angiotensin-converting enzyme 2; MEGA-X, Molecular Evolutionary Genetics Analysis version X; RBD, receptor-binding domain; SARS-CoV-2, severe acute respiratory syndrome coronavirus 2

3.2 | Structure simulation of the protein complex of SARS-CoV-2 RBD and *Bovidae/Cricetidae*/turtle/snake ACE2

Recently, the structure of SARS-CoV-2 RBD with human ACE2 has been resolved. To investigate whether *Bovidae/Cricetidae* ACE2 maintained the binding affinity with SARS-CoV-2 RBD, we simulated the potential structure of the protein complex. T82 and E30 in *Bos taurus* ACE2 kept the contact to F486 and K417 in SARS-CoV-2 S (Figure 1B). N82 and Q34 in *Cricetulus griseus* ACE2 maintained the contact to F486 and Y453 in SARS-CoV-2 S (Figure 1C). We concluded that *Bovidae/Cricetidae* ACE2 could associate with SARS-CoV-2 S (Figure 1B,C).

To investigate the potential association between SARS-CoV-2 and ACE2 from turtle and snake, we simulated the potential structure of turtle/snake ACE2 with SARS-CoV-2 RBD. The AA correlated to hACE2 Q42 is changed to A (A41) in turtle (Figure 1D). We also noticed that the AA correlated to hACE2 H34 is changed to A (A60) in a snake (Figure 1E). When the contact AA was mutated to smaller AA (A), the contact force for protein-protein interaction will be reduced. Moreover, the corresponding AA of K31 was changed to E (E30) in turtle and Q (Q57) in snake ACE2 (Figure 1D). K31 in hACE2 was critical for SARS-CoV RBD binding and ACE2-K31D mutant abolished its association with SARS-CoV RBD.[15] Taken together, turtle and snake ACE2 are unlikely to bind to S protein of SARS-CoV-2.

4 | DISCUSSION

SARS-CoV, MERS-CoV, and SARS-CoV-2 have caused severe human infectious diseases in the last 2 decades. These three human coronaviruses originated from bats, but the intermediate hosts were different. SARS-CoV came from the *Paguma larvata*,[16] and the intermediate host for MERS-CoV is *Camelus dromedaries*.[17] The new coronavirus SARS-CoV-2 has recently caused a serious pandemic in China and other countries. However, it is not clear which animals are involved in the evolution of SARS-CoV-2 and which animals may be infected by SARS-CoV-2. RBD region in S protein of pangolin coronavirus is similar to that of SARS-CoV-2,[7,8] indicating the involvement of pangolin in the recombination of SARS-CoV-2. By analyzing the codon usage of SARS-CoV-2, people suggested that snake might be a potential host for SARS-CoV-2.[9] Another study indicated that turtle is a potential intermediate host for SARS-CoV-2 based on the key AAs in ACE2 for interacting with SARS-CoV RBD.[10] The late study raised the concerns of SARS-CoV-2 infection in the turtle aquaculture and pet turtle. Most of the coronaviruses hosts are mammals; with a few of exceptions are birds. Considering that all known hosts for coronaviruses are thermostatic animals, it is unlikely that reptiles will be infected with SARS-CoV-2.

There are 20 key AAs in ACE2 critical for binding S protein of SARS-CoV-2.[11] On the basis of these 20 AAs, we analyzed the corresponding AAs in ACE2 from a list of mammal, bird, turtle, and snake. We found that the ACE2 of turtles and snake lost the capability to associate with S protein (Table 1 and Figure 1D,E). These reptiles should be ruled out from the potential host list for SARS-CoV-2. *Aves* ACE2 was unlikely to associate with SARS-CoV-2 RBD because they lost the critical K corresponding to K31 in human ACE2 (Table 1). Pangolin ACE2 was predicted to recognize SARS-CoV-2 RBD less efficiently because it only preserved 14 of 20 critical AAs (Table 1). Interestingly, we found that ACE2 proteins from *Primates*, *Bovidae*, *Cricetidae*, and *Cetacea* were capable to recognize RBD of SARS-CoV-2 by maintaining the majority of key residues in ACE2 for associating with SARS-CoV-2 RBD. Swine ACE2 (CpACE2) with 15 of 20 matched critical AAs was shown to support SARS-CoV-2 entry.[6] *Bovidae/Cricetidae* ACE2 matched more AAs than swine ACE2, thus they should recognize SARS-CoV-2 RBD. It would strengthen our conclusion if we have biochemical evidence for the S-ACE2 interaction analysis for *Bovidae/Cricetidae* ACE2. On the basis of human ACE2 and SARS-CoV-spike complex structure model (PDB ID: 2AJF), we and others recently predicted that hamster ACE2 could associate with SARS-CoV-2 and hamster might be a candidate small animal model for SARS-CoV-2 infection.[18,19] Indeed, golden Syrian hamster (*Mesocricetus auratus*) has been established as a model to study the pathogenesis and transmission of COVID-19.[19] One of *Cetacea*, *Neophocaena asiaeorientalis asiaeorientalis* (Yangtze finless porpoise), lives in the middle and lower reaches of the Yangtze River and its lakes, where Wuhan located nearby.[20] It will be interesting to investigate whether Yangtze finless porpoise could be infected with SARS-CoV-2 or related coronavirus.

In conclusion, we found that *Bovidae/Cricetidae* ACE2 but not turtle/snake ACE2 could recognize SARS-CoV-2 RBD. More attention should be paid to *Bovidae* and *Cricetidae* in hunting the potential intermediate host for SARS-CoV-2.

Great discussion! Thanks for forwarding the paper Jon, and thanks for summarizing the data Dan.
Receptor binding studies are a great and practical first step, however, susceptibility is far more complex than receptor binding. Many processes must be overcome to infect a new species and experiments are probably the only way to definitively determine susceptibility.
I reached out to Tony S to see if he had insights about Artibeus jamaicensis (susceptible) with respect to the AA considered in the paper – he looked through his transcriptome data and noted it has 13 matched AAs.
I look forward to more discussion tomorrow.
Raina

> Some food for thought while considering the effectiveness (or not) of bat workers/researchers putting on some kind of respiratory protection. This data, collected pre-COVID19, basically shows that putting on surgical masks can be effective for minimizing the spread of human coronaviruses, although the total number of patients tested was still pretty low and we don't know the extent to which COVID-19 can be spread in aerosolized form. Note that the masks weren't that effective for rhinoviruses or aerosolized flu.

Subject: Re: Expert judgement for SARS-CoV-2 risk assessment for North American bats

Hi Jon,

Thanks for passing this along. So others don't have to dig through all of the the 2.5 page table full of abbreviations, here are some scores (matching residues of the 20 key AAs considered) for a few selected species which might be relevant to judging the susceptibility of Myotis lucifugus, which had a score of 11/20:

Homo sapiens (20/20)
Sus scrofa (15/20), in vitro evidence of infection
Mustela putorius furo (15/20), in vivo susceptibility confirmed
Rhinolophus macrotis (13/20), susceptible?
Rhinolophus pusillus (14/20), susceptible?
Rhinolophus ferrumequinum (12/20), susceptible?
Desmodus rotundus (12/20), possibly susceptible (same family as Artibeus, which was not included in the study)?

So, Myotis is relatively low on the list, but so are bats which are related to the presumed reservoir and known susceptible species like ferrets are not too much higher up on the list. I'd be curious to know how others with more knowledge than myself interpret these numbers. Is this measure of ACE-2 affinity something we should use and how low is too low for a host to be susceptible?

Best,
Daniel

Jon

On Thu, Apr 9, 2020 at 5:39 PM Grant, Evan H <ehgrant wrote:

Hello experts,

Thank you for volunteering your time and expertise to help estimate the risk of SARS-CoV-2 to North American bats. Mike Runge and I (Evan Grant), with the U.S. Geological Survey Patuxent Wildlife Research Center, are facilitating this effort in collaboration with the USGS National Wildlife Health Center, USGS Fort Collins Science Center, USFWS, and EcoHealth Alliance. We are conducting a rapid assessment of the risks for transmission of SARS-CoV-2 from humans to bats. The goal is to provide scientific information that will guide wildlife management agency response to this potential risk, including development of management recommendations and mitigation strategies.

Attached please find two documents: (1) an introduction to expert elicitation with some background on the issue we are addressing, and (2) a spreadsheet <BatEE Practice Questions v2.xlsx> with calibration questions. There are three tabs (corresponding to the three questions) in the accompanying spreadsheet, and a fourth tab that summarizes the responses and the calculated mean and standard deviation for each question.

We have a very tight timeline to provide guidance to U.S. management agencies, so we thank you for your participation along the following timeline:

i. Respond to ehgrant with your responses to the calibration questions in the attached spreadsheet (due by 12 PM ET 10 Apr)

ii. Review the background information and elicitation questions (we will

send these additional documents to you by 6 pm ET 10 Apr)

iii. Respond with your initial responses to the questions (due by 6 PM ET 13 Apr)

iv. Be available for a 2-hr conference call to discuss initial responses and share insights (4 PM ET 14 Apr – and/or – 4 PM ET 15 Apr)

v. Revise and send your second-round responses to the questions (due 24 hours after the last conference call)

Thank you in advance for your participation. If you have questions – please contact Evan (ehgrant

Kindest regards,
Evan and Mike

Position Statement:
Rehabilitating North American Bats during the SARS-CoV2/COVID-19 Pandemic

The newly emerging SARS-CoV2, which causes COVID-19 in humans, is currently a worldwide pandemic and has been diagnosed in people from every state and province in the United States[1] and Canada. A summary of the non-human animal SARS-CoV2 positive individuals as of 4/10/2020 is provided as an appendix at the end of this statement. Zoonotic transmission from these animals back to humans has not been reported.

Currently, it is thought that the newly emerging SARS-CoV2 virus originated from wildlife and possibly from East Asian pangolins, and/or East Asian bats[3]. Details about these theories are summarized at the end of this statement. **SARS-CoV2 has not been found naturally in any wild bat**. One preliminary study did show the ability to infect Egyptian fruit bats with SARS-CoV2 in a research setting, however, they did not shed enough virus to infect conspecifics[4]. There are over 1400 different species of bats[5], and it is unknown if this virus acts similarly in other species of bats. Many other coronaviruses use bats as a reservoir[6],[7] and **there is currently no evidence that introduction of SARS-CoV2 to North American bats would or would not cause population declines.**

A certain percentage of humans can be asymptomatic shedders of SARS-CoV2[1]. Current expert understanding is that SARS-CoV2 is primarily transmitted person-to-person, and not a current zoonotic concern in any species[8].

Many species of North American bats are incredibly adaptable and live in and around human dwellings (houses, attics, flashing, backyard foliage and trees, etc.), even in dense human populations. Bats come into close proximity of many people every day.

Wildlife rehabilitators across the continent who are trained to work with bats are a valuable public health resource. Members of the public come into contact with bats regularly, and often are directly exposed to bats before contacting professionals. Wildlife rehabilitators direct these individuals to local public health departments, help walk individuals through learning about rabies risk factors and following all public health recommendations, and ultimately act as an advocate for the health of the finder and the bat.

The NWRA Veterinary Committee supports the continued admittance of bats for rehabilitation to wildlife rehabilitation professionals not only to ensure proper bat care, welfare, and conservation, but foremost as part of the solution to public health concerns surrounding bats. Without wildlife rehabilitators, it is highly likely the public will have more human-bat interactions

that lack the involvement of a professional to guide zoonotic concerns and take necessary biosecurity precautions. Wildlife rehabilitators also represent a valuable resource for sample collection for researchers and are encouraged to collaborate whenever possible.

The NWRA Veterinary Committee supports one-health initiatives to improve human health, animal health and environmental health. Furthermore, the NWRA Veterinary Committee supports evidence-based medicine and subsequent actions.

Restrictions on bat rehabilitation and release have massive implications for the thousands of bats that are rehabilitated in the US and Canada each year, and for the adverse human-bat interactions that will inevitably occur as untrained people continue to find bats in need of care. If SARS-CoV2 is able to be transmitted from humans to bats, it has likely already occurred due to the high number of human cases in the United States and the frequency that people interact with bats at their homes.

Furthermore, due to the COVID-19 outbreak, fewer resources are available at municipalities to handle wildlife cases resulting in additional risk for the public who may take it upon themselves to handle a bat, without appropriate PPE, thus potentially having a negative impact on the health and welfare of the bat and the health of the person who handled it. Wildlife rehabilitators' expertise is needed even more during this crisis to protect human and animal health.

RECOMMENDATIONS

1. We recommend that authorized wildlife rehabilitators should be allowed to accept and rehabilitate bats, following appropriate biosecurity and safety measures to prevent human-bat respiratory virus exposures.
2. New bat admissions should be quarantined for 14 days.
3. There is no need to euthanize captive bats as a method of disease prevention.
4. Limit the number of people who have access to areas where bats are housed and cared for.
5. Rehabilitators showing any clinical signs of Covid-19 such as fever, coughing, or shortness of breath should immediately cease working with bats and consult their doctor for testing and quarantine recommendations. Backup caregivers should be pre-arranged for bats and any other animals undergoing rehabilitation.
6. Working with the local or regional veterinary laboratories and state/provincial public health officials, samples should be collected from rehabilitated bats if feasible, and if/when testing for bats is available, the bats should be tested for Covid-19 prior to release if available. However, bats should not be delayed from appropriate release simply because testing is not available.

Because this is an emerging pathogen, new research may sway directives and this statement will be updated accordingly.

Appendix

Since the outbreak of severe acute respiratory syndrome (SARS) 18 years ago, a large number of SARS-related coronaviruses (SARSr-CoVs) have been discovered in their natural reservoir host, bats, and previous studies have shown that some bat SARSr-CoVs have the potential to infect humans.[6]

The coronaviruses found in the Malayan pangolin (*Manis javanica*) and the *Rhinolophus affinis* bat remain the current closest to SARS-CoV2 across the genome (~96%[6]); some pangolin coronaviruses exhibit strong similarity to SARS-CoV2 in the virus receptor binding domain (RBD), including all six key RBD residues.[3] However, bat coronaviruses are massively understudied[3].

Currently, it is thought that SARS-CoV2 virus originated from wildlife naturally[3], either via natural selection in the species in question before zoonotic transfer or natural selection in humans after zoonotic transfer from the species in question[3]. See the table below for current knowledge regarding positive test results suggestive of human to animal transmission of SARS-CoV2.

Summary below of current non-human animals that have tested positive for SARS-CoV2A[8]:

Species	Location	Antigen test results	Antibody test results	Symptoms	Possible source	Notes
Domestic dog	China	Weak positive	Positive	None	Owner had COVID-19	Elderly, died 3 d after release from unknown causes
Domestic dog[11]	Hong Kong	Positive		None	Owner had COVID-19	German Shepherd
Domestic cat	Belgium	Positive	--	Respiratory, vomiting	Owner had COVID-19	Unknowns around sampling
Domestic cat	China	Positive	--	None	Owner had COVID-19	
Tiger	NY, USA	Positive Confirmed by NVSL		Respiratory	Presumed asymptomatic keeper positive for COVID-19	Several big cats in zoo sick with respiratory signs
Domestic cats[12]	China	Positive (15)	Positive (11)	None? Not clear in report	Owned and stray (community acquired)	Tested 102 cats in Wuhan
Domestic cat	Hong Kong	Positive		None	Owner had COVID-19

Some food for thought while considering the effectiveness (or not) of bat workers/researchers putting on some kind of respiratory protection. This data, collected pre-COVID19, basically shows that putting on surgical masks can be effective for minimizing the spread of human coronaviruses, although the total number of patients tested was still pretty low and we don't know the extent to which COVID-19 can be spread in aerosolized form. Note that the masks weren't that effective for rhinoviruses or aerosolized flu.

Subject: Re: Expert judgement for SARS-CoV-2 risk assessment for North American bats

Hi Jon,

Thanks for passing this along. So others don't have to dig through all of the the 2.5 page table full of abbreviations, here are some scores (matching residues of the 20 key AAs considered) for a few selected species which might be relevant to judging the susceptibility of Myotis lucifugus, which had a score of 11/20:

Homo sapiens (20/20)
Sus scrofa (15/20), in vitro evidence of infection
Mustela putorius furo (15/20), in vivo susceptibility confirmed
Rhinolophus macrotis (13/20), susceptible?
Rhinolophus pusillus (14/20), susceptible?
Rhinolophus ferrumequinum (12/20), susceptible?
Desmodus rotundus (12/20), possibly susceptible (same family as Artibeus, which was not included in the study)?

So, Myotis is relatively low on the list, but so are bats which are related to the presumed reservoir and known susceptible species like ferrets are not too much higher up on the list. I'd be curious to know how others with more knowledge than myself interpret these numbers. Is this measure of ACE-2 affinity something we should use and how low is too low for a host to be susceptible?

Best,
Daniel

Hello experts,

Thank you for volunteering your time and expertise to help estimate the risk of SARS-CoV-2 to North American bats. Mike Runge and I (Evan Grant), with the U.S. Geological Survey Patuxent Wildlife Research Center, are facilitating this effort in collaboration with the USGS National Wildlife Health Center, USGS Fort Collins Science Center, USFWS, and EcoHealth Alliance. We are conducting a rapid assessment of the risks for transmission of SARS-CoV-2 from humans to bats. The goal is to provide scientific information that will guide wildlife management agency response to this potential risk, including development of management recommendations and mitigation strategies.

Attached please find two documents: (1) an introduction to expert elicitation with some background on the issue we are addressing, and (2) a spreadsheet <BatEE Practice Questions v2.xlsx> with calibration questions. There are three tabs (corresponding to the three questions) in the accompanying spreadsheet, and a fourth tab that summarizes the responses and the calculated mean and standard deviation for each question.

We have a very tight timeline to provide guidance to U.S. management agencies, so we thank you for your participation along the following timeline:

i. Respond to ehgrant with your responses to the calibration questions in the attached spreadsheet (due by 12 PM ET 10 Apr)

ii. Review the background information and elicitation questions (we will send these additional documents to you by 6 pm ET 10 Apr)

iii. Respond with your initial responses to the questions (due by 6 PM ET 13 Apr)

iv. Be available for a 2-hr conference call to discuss initial responses and share insights (4 PM ET 14 Apr – and/or – 4 PM ET 15 Apr)

v. Revise and send your second-round responses to the questions (due 24 hours after the last conference call)

Thank you in advance for your participation. If you have questions – please contact Evan (ehgrant .

Kindest regards,
Evan and Mike

BRIEF COMMUNICATION

https://doi.org/10.1038/s41591-020-0843-2

Respiratory virus shedding in exhaled breath and efficacy of face masks

Nancy H. L. Leung[1], Daniel K. W. Chu[1], Eunice Y. C. Shiu[1], Kwok-Hung Chan[2], James J. McDevitt[3], Benien J. P. Hau[1,4], Hui-Ling Yen[1], Yuguo Li[5], Dennis K. M. Ip[1], J. S. Malik Peiris[1], Wing-Hong Seto[1,6], Gabriel M. Leung[1], Donald K. Milton[7,8] and Benjamin J. Cowling[1,8] ✉

We identified seasonal human coronaviruses, influenza viruses and rhinoviruses in exhaled breath and coughs of children and adults with acute respiratory illness. Surgical face masks significantly reduced detection of influenza virus RNA in respiratory droplets and coronavirus RNA in aerosols, with a trend toward reduced detection of coronavirus RNA in respiratory droplets. Our results indicate that surgical face masks could prevent transmission of human coronaviruses and influenza viruses from symptomatic individuals.

Respiratory virus infections cause a broad and overlapping spectrum of symptoms collectively referred to as acute respiratory virus illnesses (ARIs) or more commonly the 'common cold'. Although mostly mild, these ARIs can sometimes cause severe disease and death[1]. These viruses spread between humans through direct or indirect contact, respiratory droplets (including larger droplets that fall rapidly near the source as well as coarse aerosols with aerodynamic diameter >5 µm) and fine-particle aerosols (droplets and droplet nuclei with aerodynamic diameter ≤5 µm)[2,3]. Although hand hygiene and use of face masks, primarily targeting contact and respiratory droplet transmission, have been suggested as important mitigation strategies against influenza virus transmission[4], little is known about the relative importance of these modes in the transmission of other common respiratory viruses[2,3,5]. Uncertainties similarly apply to the modes of transmission of COVID-19 (refs. [6,7]).

Some health authorities recommend that masks be worn by ill individuals to prevent onward transmission (source control)[4,8]. Surgical face masks were originally introduced to protect patients from wound infection and contamination from surgeons (the wearer) during surgical procedures, and were later adopted to protect healthcare workers against acquiring infection from their patients. However, most of the existing evidence on the filtering efficacy of face masks and respirators comes from in vitro experiments with nonbiological particles[9,10], which may not be generalizable to infectious respiratory virus droplets. There is little information on the efficacy of face masks in filtering respiratory viruses and reducing viral release from an individual with respiratory infections[8], and most research has focused on influenza[11,12].

Here we aimed to explore the importance of respiratory droplet and aerosol routes of transmission with a particular focus on coronaviruses, influenza viruses and rhinoviruses, by quantifying the amount of respiratory virus in exhaled breath of participants with medically attended ARIs and determining the potential efficacy of surgical face masks to prevent respiratory virus transmission.

Results

We screened 3,363 individuals in two study phases, ultimately enrolling 246 individuals who provided exhaled breath samples (Extended Data Fig. 1). Among these 246 participants, 122 (50%) participants were randomized to not wearing a face mask during the first exhaled breath collection and 124 (50%) participants were randomized to wearing a face mask. Overall, 49 (20%) voluntarily provided a second exhaled breath collection of the alternate type.

Infections by at least one respiratory virus were confirmed by reverse transcription PCR (RT–PCR) in 123 of 246 (50%) participants. Of these 123 participants, 111 (90%) were infected by human (seasonal) coronavirus ($n=17$), influenza virus ($n=43$) or rhinovirus ($n=54$) (Extended Data Figs. 1 and 2), including one participant co-infected by both coronavirus and influenza virus and another two participants co-infected by both rhinovirus and influenza virus. These 111 participants were the focus of our analyses.

There were some minor differences in characteristics of the 111 participants with the different viruses (Table 1a). Overall, 24% of participants had a measured fever ≥37.8 °C, with patients with influenza more than twice as likely than patients infected with coronavirus and rhinovirus to have a measured fever. Coronavirus-infected participants coughed the most with an average of 17 (s.d. = 30) coughs during the 30-min exhaled breath collection. The profiles of the participants randomized to with-mask versus without-mask groups were similar (Supplementary Table 1).

We tested viral shedding (in terms of viral copies per sample) in nasal swabs, throat swabs, respiratory droplet samples and aerosol samples and compared the latter two between samples collected with or without a face mask (Fig. 1). On average, viral shedding was higher in nasal swabs than in throat swabs for each of coronavirus (median 8.1 $\log_{10}$ virus copies per sample versus 3.9), influenza virus (6.7 versus 4.0) and rhinovirus (6.8 versus 3.3), respectively. Viral RNA was identified from respiratory droplets and aerosols for all three viruses, including 30%, 26% and 28% of respiratory droplets and 40%, 35% and 56% of aerosols collected while not wearing a face mask, from coronavirus, influenza virus and rhinovirus-infected participants, respectively (Table 1b). In particular for coronavirus, we identified OC43 and HKU1 from both respiratory

P values for comparing the frequency of respiratory virus detection between the mask intervention were obtained by two-sided Fisher's exact test and (two-sided) *P* values for mask intervention as predictor of log_{10} virus copies per sample were obtained by an unadjusted univariate Tobit regression model, which allowed for censoring at the lower limit of detection of the RT-PCR assay, with significant differences in bold. Undetectable values were imputed as 0.3 log_{10} virus copies per sample. IQR, interquartile range.

respiratory droplet and aerosol samples collected without face masks, respectively. There was a significant reduction by wearing face masks to 1 of 27 (4%) in detection of influenza virus in respiratory droplets, but no significant reduction in detection in aerosols (Table 1b). Moreover, among the eight participants who had influenza virus detected by RT–PCR from without-mask aerosols, five were tested by viral culture and four were culture-positive. Among the six participants who had influenza virus detected by RT–PCR from with-mask aerosols, four were tested by viral culture and two were culture-positive. For rhinovirus, there were no significant differences between detection of virus with or without face masks, both in respiratory droplets and in aerosols (Table 1b). Conclusions were similar in comparisons of viral shedding (Table 1b). In addition, we found a significant reduction in viral shedding (Supplementary Table 2) in respiratory droplets for OC43 (Extended Data Fig. 4) and influenza B virus (Extended Data Fig. 5) and in aerosols for NL63 (Extended Data Fig. 4).

We identified correlations between viral loads in different samples (Extended Data Figs. 6–8) and some evidence of declines in viral shedding by time since onset for influenza virus but not for coronavirus or rhinovirus (Extended Data Fig. 9). In univariable analyses of factors associated with detection of respiratory viruses in various sample types, we did not identify significant association in viral shedding with days since symptom onset (Supplementary Table 3) for respiratory droplets or aerosols (Supplementary Tables 4–6).

A subset of participants (72 of 246, 29%) did not cough at all during at least one exhaled breath collection, including 37 of 147 (25%) during the without-mask and 42 of 148 (28%) during the with-mask breath collection. In the subset for coronavirus ($n=4$), we did not detect any virus in respiratory droplets or aerosols from any participants. In the subset for influenza virus ($n=9$), we detected virus in aerosols but not respiratory droplets from one participant. In the subset for rhinovirus ($n=17$), we detected virus in respiratory droplets from three participants, and we detected virus in aerosols in five participants.

Discussion

Our results indicate that aerosol transmission is a potential mode of transmission for coronaviruses as well as influenza viruses and rhinoviruses. Published studies detected respiratory viruses[13,14] such as influenza[12,15] and rhinovirus[16] from exhaled breath, and the detection of SARS-CoV[17] and MERS-CoV[18] from air samples (without size fractionation) collected from hospitals treating patients with severe acute respiratory syndrome and Middle East respiratory syndrome, but ours demonstrates detection of human seasonal coronaviruses in exhaled breath, including the detection of OC43 and HKU1 from respiratory droplets and NL63, OC43 and HKU1 from aerosols.

Our findings indicate that surgical masks can efficaciously reduce the emission of influenza virus particles into the environment in respiratory droplets, but not in aerosols[12]. Both the previous and current study used a bioaerosol collecting device, the Gesundheit-II (G-II)[12,15,19], to capture exhaled breath particles and differentiated them into two size fractions, where exhaled breath coarse particles >5 µm (respiratory droplets) were collected by impaction with a 5-µm slit inertial Teflon impactor and the remaining fine particles ≤5 µm (aerosols) were collected by condensation in buffer. We also demonstrated the efficacy of surgical masks to reduce coronavirus detection and viral copies in large respiratory droplets and in aerosols (Table 1b). This has important implications for control of COVID-19, suggesting that surgical face masks could be used by ill people to reduce onward transmission.

Among the samples collected without a face mask, we found that the majority of participants with influenza virus and coronavirus infection did not shed detectable virus in respiratory droplets or aerosols, whereas for rhinovirus we detected virus in aerosols in 19 of 34 (56%) participants (compared to 4 of 10 (40%) for influenza and 8 of 23 (35%) for coronavirus). For those who did shed virus in respiratory droplets and aerosols, viral load in both tended to be low (Fig. 1). Given the high collection efficiency of the G-II (ref. [19]) and given that each exhaled breath collection was conducted for 30 min, this might imply that prolonged close contact would be required for transmission to occur, even if transmission was primarily via aerosols, as has been described for rhinovirus colds[20]. Our results also indicate that there could be considerable heterogeneity in contagiousness of individuals with coronavirus and influenza virus infections.

The major limitation of our study was the large proportion of participants with undetectable viral shedding in exhaled breath for each of the viruses studied. We could have increased the sampling duration beyond 30 min to increase the viral shedding being captured, at the cost of acceptability in some participants. An alternative approach would be to invite participants to perform forced coughs during exhaled breath collection[12]. However, it was the aim of our present study to focus on recovering respiratory

virus in exhaled breath in a real-life situation and we expected that some individuals during an acute respiratory illness would not cough much or at all. Indeed, we identified virus RNA in a small number of participants who did not cough at all during the 30-min exhaled breath collection, which would suggest droplet and aerosol routes of transmission are possible from individuals with no obvious signs or symptoms. Another limitation is that we did not confirm the infectivity of coronavirus or rhinovirus detected in exhaled breath. While the G-II was designed to preserve viability of viruses in aerosols, and in the present study we were able to identify infectious influenza virus in aerosols, we did not attempt to culture coronavirus or rhinovirus from the corresponding aerosol samples.

Methods

Study design. Participants were recruited year-round from March 2013 through May 2016 in a general outpatient clinic of a private hospital in Hong Kong. As routine practice, clinic staff screened all individuals attending the clinics for respiratory and any other symptoms regardless of the purpose of the visit at triage. Study staff then approached immediately those who reported at least one of the following symptoms of ARI for further screening: fever ≥37.8 °C, cough, sore throat, runny nose, headache, myalgia and phlegm. Individuals who reported ≥2 ARI symptoms, within 3 d of illness onset and ≥11 years of age were eligible to participate. After explaining the study to and obtaining informed consent from the participants, a rapid influenza diagnostic test, the Sofia Influenza A + B Fluorescent Immunoassay Analyzer (cat. no. 20218, Quidel), was used to identify influenza A or B virus infection as an incentive to participate. All participants provided a nasal swab for the rapid test and an additional nasal swab and a separate throat swab for subsequent virologic confirmation at the laboratory. All participants also completed a questionnaire to record basic information including age, sex, symptom severity, medication, medical conditions and smoking history. In the first phase of the study from March 2013 to February 2014 ('Influenza Study'), the result of the rapid test was used to determine eligibility for further participation in the study and exhaled breath collection, whereas in the second phase of the study from March 2014 to May 2016 ('Respiratory Virus Study'), the rapid test did not affect eligibility. Eligible participants were then invited to provide an exhaled breath sample for 30 min in the same clinic visit.

Before exhaled breath collection, each participant was randomly allocated in a 1:1 ratio to either wearing a surgical face mask (cat. no. 62356, Kimberly-Clark) or not during the collection. To mimic the real-life situation, under observation by the study staff, participants were asked to attach the surgical mask themselves, but instruction on how to wear the mask properly was given when the participant wore the mask incorrectly. Participants were instructed to breathe as normal during the collection, but (natural) coughing was allowed and the number of coughs was recorded by study staff. Participants were then invited to provide a second exhaled breath sample of the alternate type (for example if the participant was first assigned to wearing a mask they would then provide a second sample without a mask), but most participants did not agree to stay for a second measurement because of time constraints. Participants were compensated for each 30-min exhaled breath collection with a supermarket coupon worth approximately US$30 and all participants were gifted a tympanic thermometer worth approximately US$20.

Ethical approval. Written informed consent was obtained from all participants ≥18 years of age and written informed consent was obtained from parents or legal guardians of participants 11–17 years of age in addition to their own written informed consent. The study protocol was approved by the Institutional Review Board of The University of Hong Kong and the Clinical and Research Ethics Committee of Hong Kong Baptist Hospital.

Collection of swabs and exhaled breath particles. Nasal swabs and throat swabs were collected separately, placed in virus transport medium, stored and transported to the laboratory at 2–8 °C and the virus transport medium was aliquoted and stored at −70 °C until further analysis. Exhaled breath particles were captured and differentiated into two size fractions, the coarse fraction containing particles with aerodynamic diameter >5 µm (referred to here as 'respiratory droplets'), which included droplets up to approximately 100 µm in diameter and the fine fraction with particles ≤5 µm (referred to here as 'aerosols') by the G-II bioaerosol collecting device[12,15,19]. In the G-II device, exhaled breath coarse particles >5 µm were collected by a 5-µm slit inertial Teflon impactor and the remaining fine particles ≤5 µm were condensed and collected into approximately 170 ml of 0.1% BSA/PBS. Both the impactor and the condensate were stored and transported to the laboratory at 2–8 °C. The virus on the impactor was recovered into 1 ml and the condensate was concentrated into 2 ml of 0.1% BSA/PBS, aliquoted and stored at −70 °C until further analysis. In a validation study, the G-II was able to recover over 85% of fine particles >0.05 µm in size and had comparable collection efficiency of influenza virus as the SKC BioSampler[19].

Laboratory testing. Samples collected from the two studies were tested at the same time. Nasal swab samples were first tested by a diagnostic-use viral panel, xTAG Respiratory Viral Panel (Abbott Molecular) to qualitatively detect 12 common respiratory viruses and subtypes including coronaviruses (NL63, OC43, 229E and HKU1), influenza A (nonspecific, H1 and H3) and B viruses, respiratory syncytial virus, parainfluenza virus (types 1–4), adenovirus, human metapneumovirus and enterovirus/rhinovirus. After one or more of the candidate respiratory viruses was detected by the viral panel from the nasal swab, all the samples from the same participant (nasal swab, throat swab, respiratory droplets and aerosols) were then tested with RT–PCR specific for the candidate virus(es) for determination of virus concentration in the samples. Infectious influenza virus was identified by viral culture using MDCK cells as described previously[21], whereas viral culture was not performed for coronavirus and rhinovirus.

Statistical analyses. The primary outcome of the study was virus generation rate in tidal breathing of participants infected by different respiratory viruses and the efficacy of face masks in preventing virus dissemination in exhaled breath, separately considering the respiratory droplets and aerosols. The secondary outcomes were correlation between viral shedding in nose swabs, throat swabs, respiratory droplets and aerosols and factors affecting viral shedding in respiratory droplets and aerosols.

We identified three groups of respiratory viruses with the highest frequency of infection as identified by RT–PCR, namely coronavirus (including NL63, OC43, HKU1 and 229E), influenza virus and rhinovirus, for further statistical analyses. We defined viral shedding as $\log_{10}$ virus copies per sample and plotted viral shedding in each sample (nasal swab, throat swab, respiratory droplets and aerosols); the latter two were stratified by mask intervention. As a proxy for the efficacy of face masks in preventing transmission of respiratory viruses via respiratory droplet and aerosol routes, we compared the respiratory virus viral shedding in respiratory droplet and aerosol samples between participants wearing face masks or not, by comparing the frequency of detection with a two-sided Fisher's exact test and by comparing viral load (defined as $\log_{10}$ virus copies per sample) by an unadjusted univariate Tobit regression model, which allowed for censoring at the lower limit of detection of the RT–PCR assay. We also used the unadjusted univariate Tobit regression to investigate factors affecting viral shedding in respiratory droplets and aerosols without mask use, for example age, days since symptom onset, previous influenza vaccination, current medication and number of coughs during exhaled breath collection. We investigated correlations between viral shedding in nasal swab, throat swab, respiratory droplets and aerosols with scatter-plots and calculated the Spearman's rank correlation coefficient between any two types of samples. We imputed 0.3 $\log_{10}$ virus copies ml^{-1} for undetectable values before transformation to $\log_{10}$ virus copies per sample. All analyses were conducted with R v.3.6.0 (ref. [22]) and the VGAM package v.1.1.1 (ref. [23]).

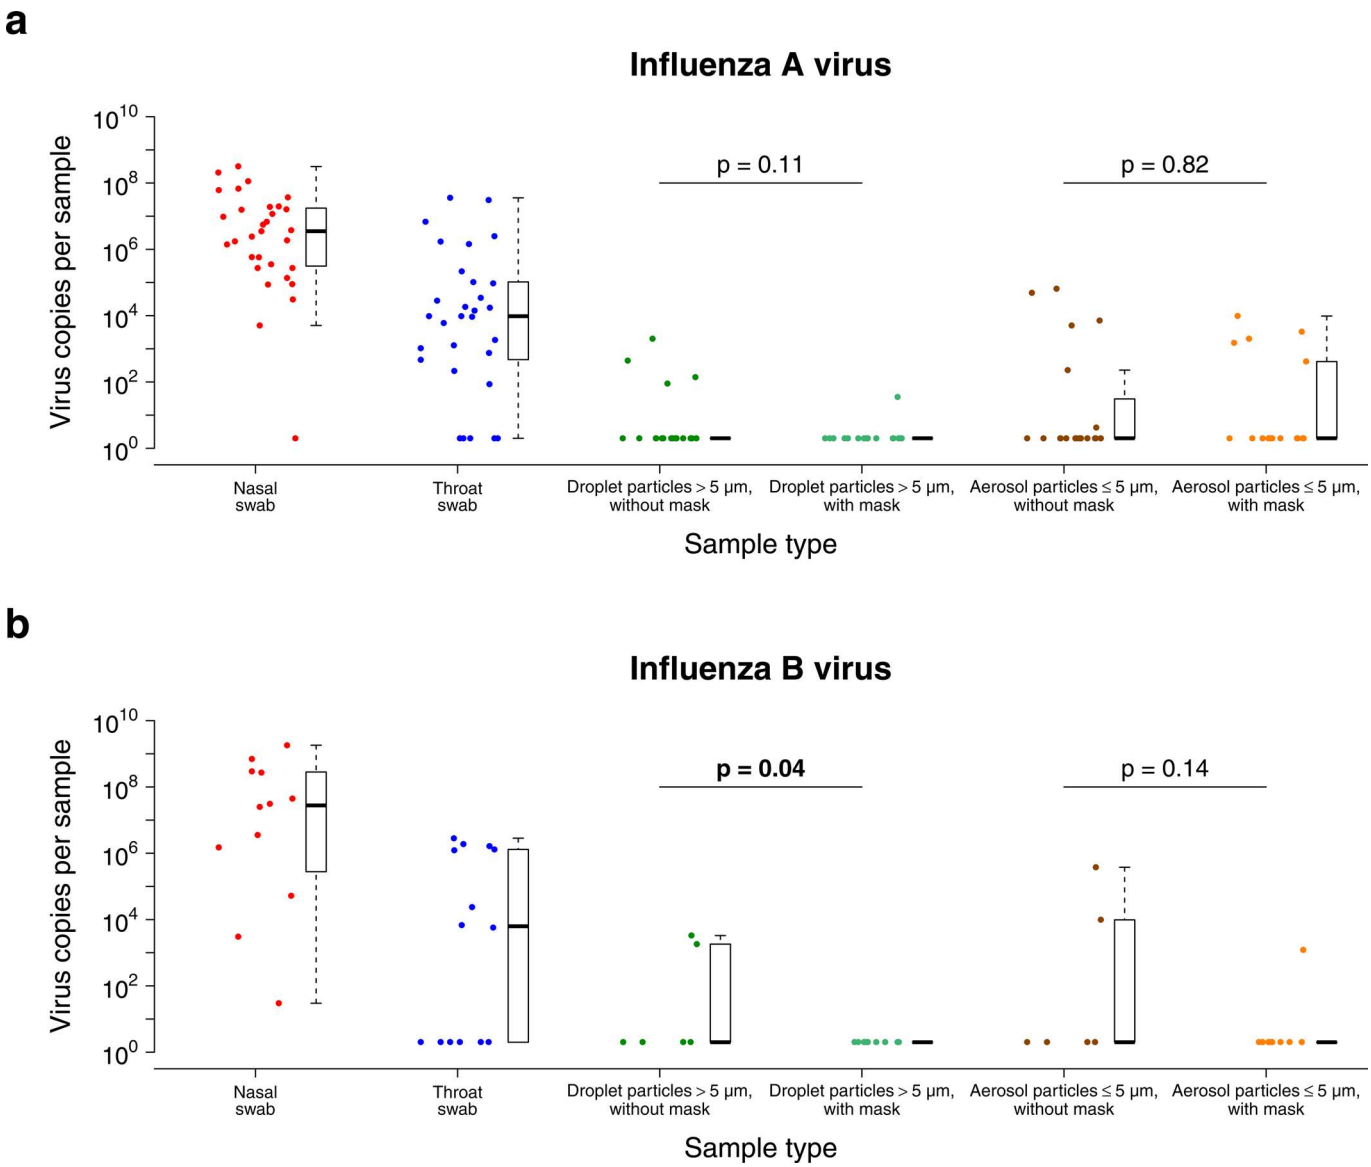
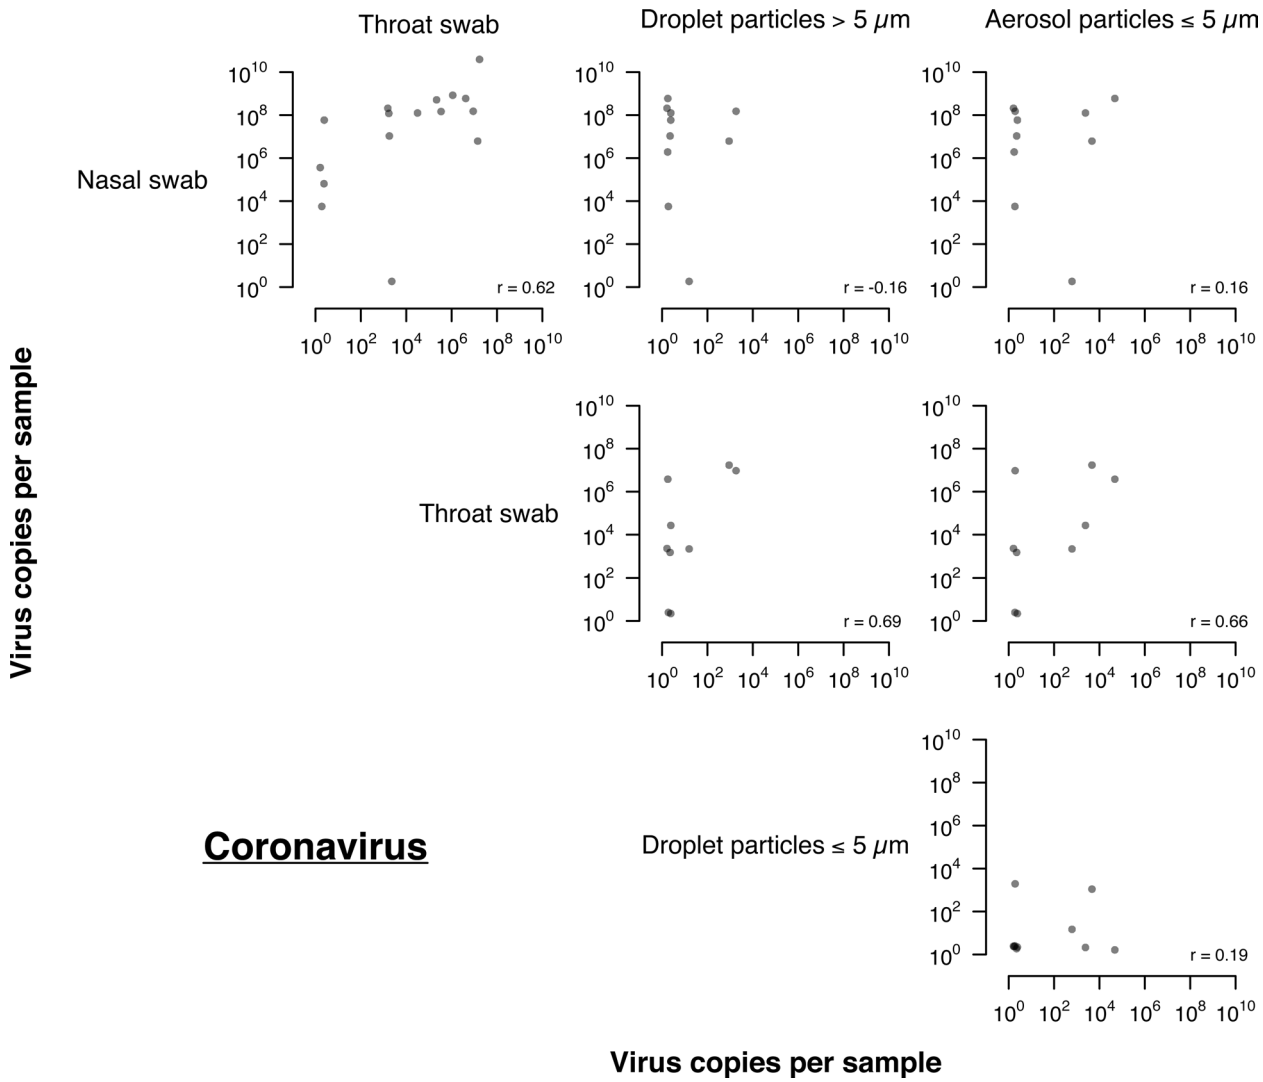
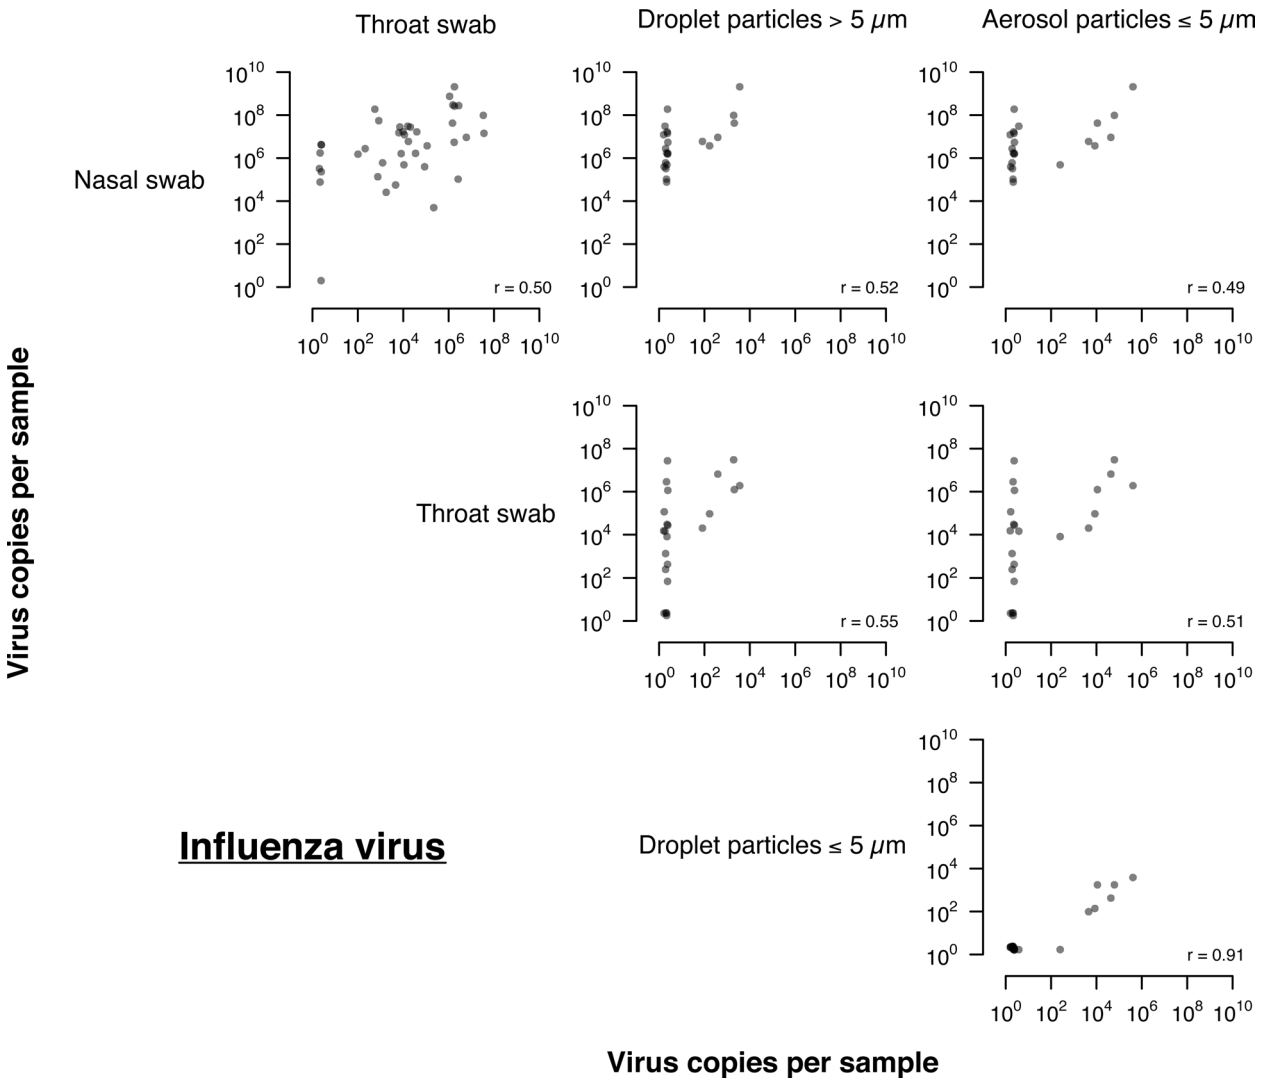
Extended Data Fig. 4 | Efficacy of surgical face masks in reducing respiratory virus shedding in respiratory droplets and aerosols of symptomatic individuals with seasonal coronaviruses including (a) coronavirus NL63, (b) coronavirus OC43 and (c) coronavirus HKU1. The figure shows the virus copies per sample collected in nasal swab (red), throat swab (blue), respiratory droplets collected for 30 min while not wearing (dark green) or wearing (light green) a surgical face mask and aerosols collected for 30 min while not wearing (brown) or wearing (orange) a face mask, collected from individuals with acute respiratory symptoms who were positive for coronavirus NL63, coronavirus OC43 and coronavirus HKU1 as determined by RT-PCR in any samples. *P* values for mask intervention as predictor of $\log_{10}$ virus copies per sample in an unadjusted univariate Tobit regression model which allowed for censoring at the lower limit of detection of the RT-PCR assay are shown, with significant differences in bold. For nasal swabs and throat swabs, all infected individuals were included (coronavirus NL63, n = 8; coronavirus OC43, n = 5; coronavirus HKU1, n = 4). For respiratory droplets and aerosols, numbers of infected individuals who provided exhaled breath samples while not wearing or wearing a surgical face mask, respectively were: coronavirus NL63 (n = 3 and 5), coronavirus OC43 (n = 3 and 4), coronavirus HKU1 (n = 4 and 2). A subset of participants provided exhaled breath samples for both mask interventions (coronavirus NL63, n = 0; coronavirus OC43, n = 2; coronavirus HKU1, n = 2).



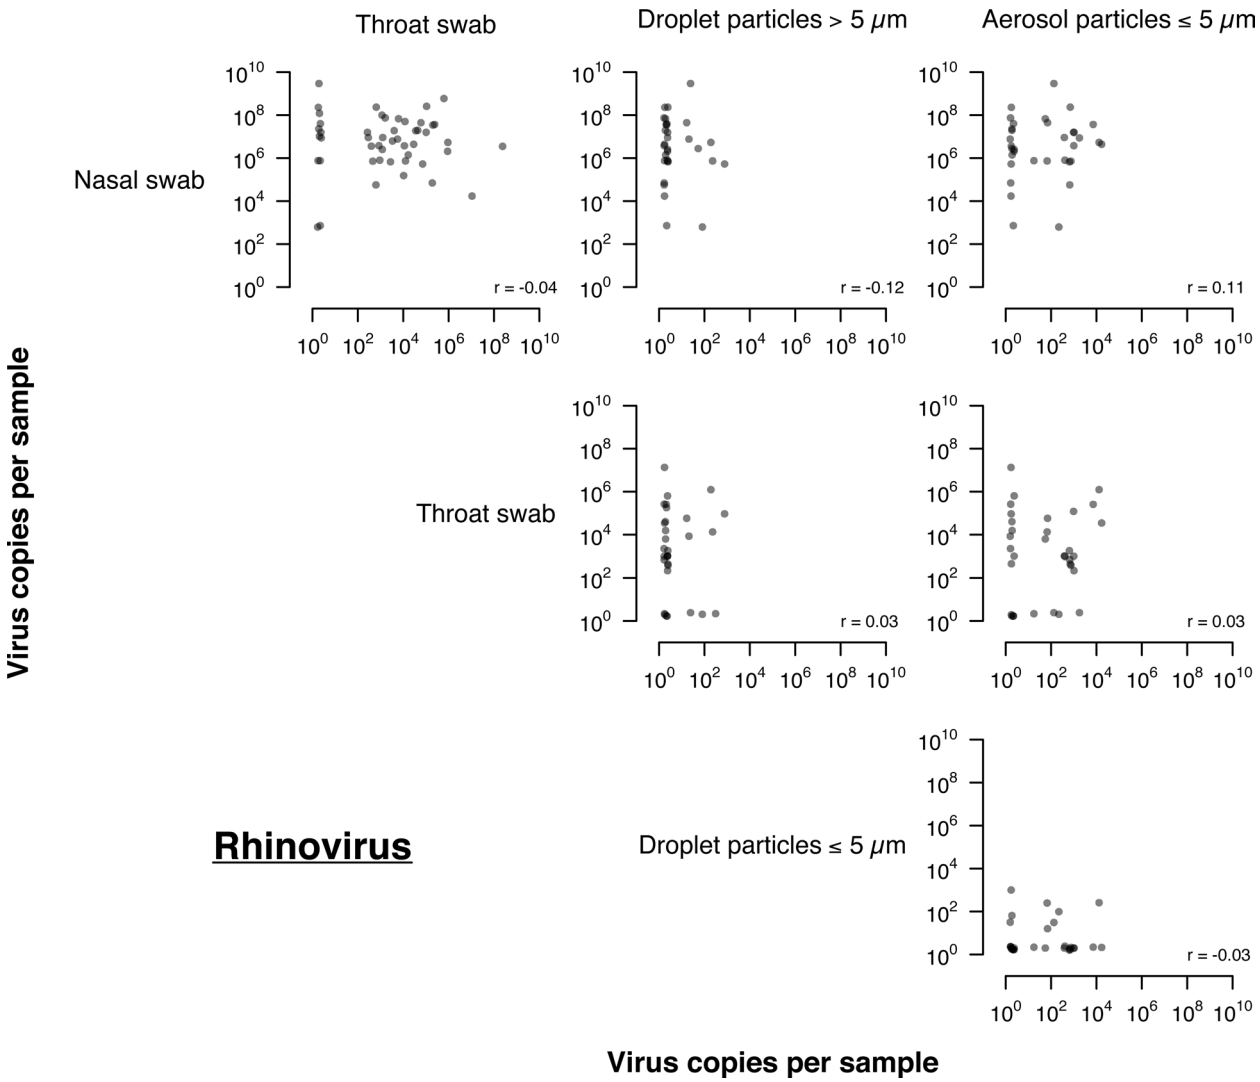
Extended Data Fig. 5 | Efficacy of surgical face masks in reducing respiratory virus shedding in respiratory droplets and aerosols of symptomatic individuals with seasonal influenza viruses including (a) influenza A and (b) influenza B virus. The figure shows the virus copies per sample collected in nasal swab (red), throat swab (blue), respiratory droplets collected for 30 min while not wearing (dark green) or wearing (light green) a surgical face mask and aerosols collected for 30 min while not wearing (brown) or wearing (orange) a face mask, collected from individuals with acute respiratory symptoms who were positive for influenza A and influenza B virus as determined by RT-PCR in any samples. *P* values for mask intervention as predictor of $\log_{10}$ virus copies per sample in an unadjusted univariate Tobit regression model which allowed for censoring at the lower limit of detection of the RT-PCR assay are shown, with significant differences in bold. For nasal swabs and throat swabs, all infected individuals were included (influenza A virus, n = 31; influenza B virus, n = 14). For respiratory droplets and aerosols, numbers of infected individuals who provided exhaled breath samples while not wearing or wearing a surgical face mask, respectively were: influenza A virus (n = 19 and 19), influenza B virus (n = 6 and 10). A subset of participants provided exhaled breath samples for both mask interventions (influenza A virus, n = 7; influenza B virus, n = 2).



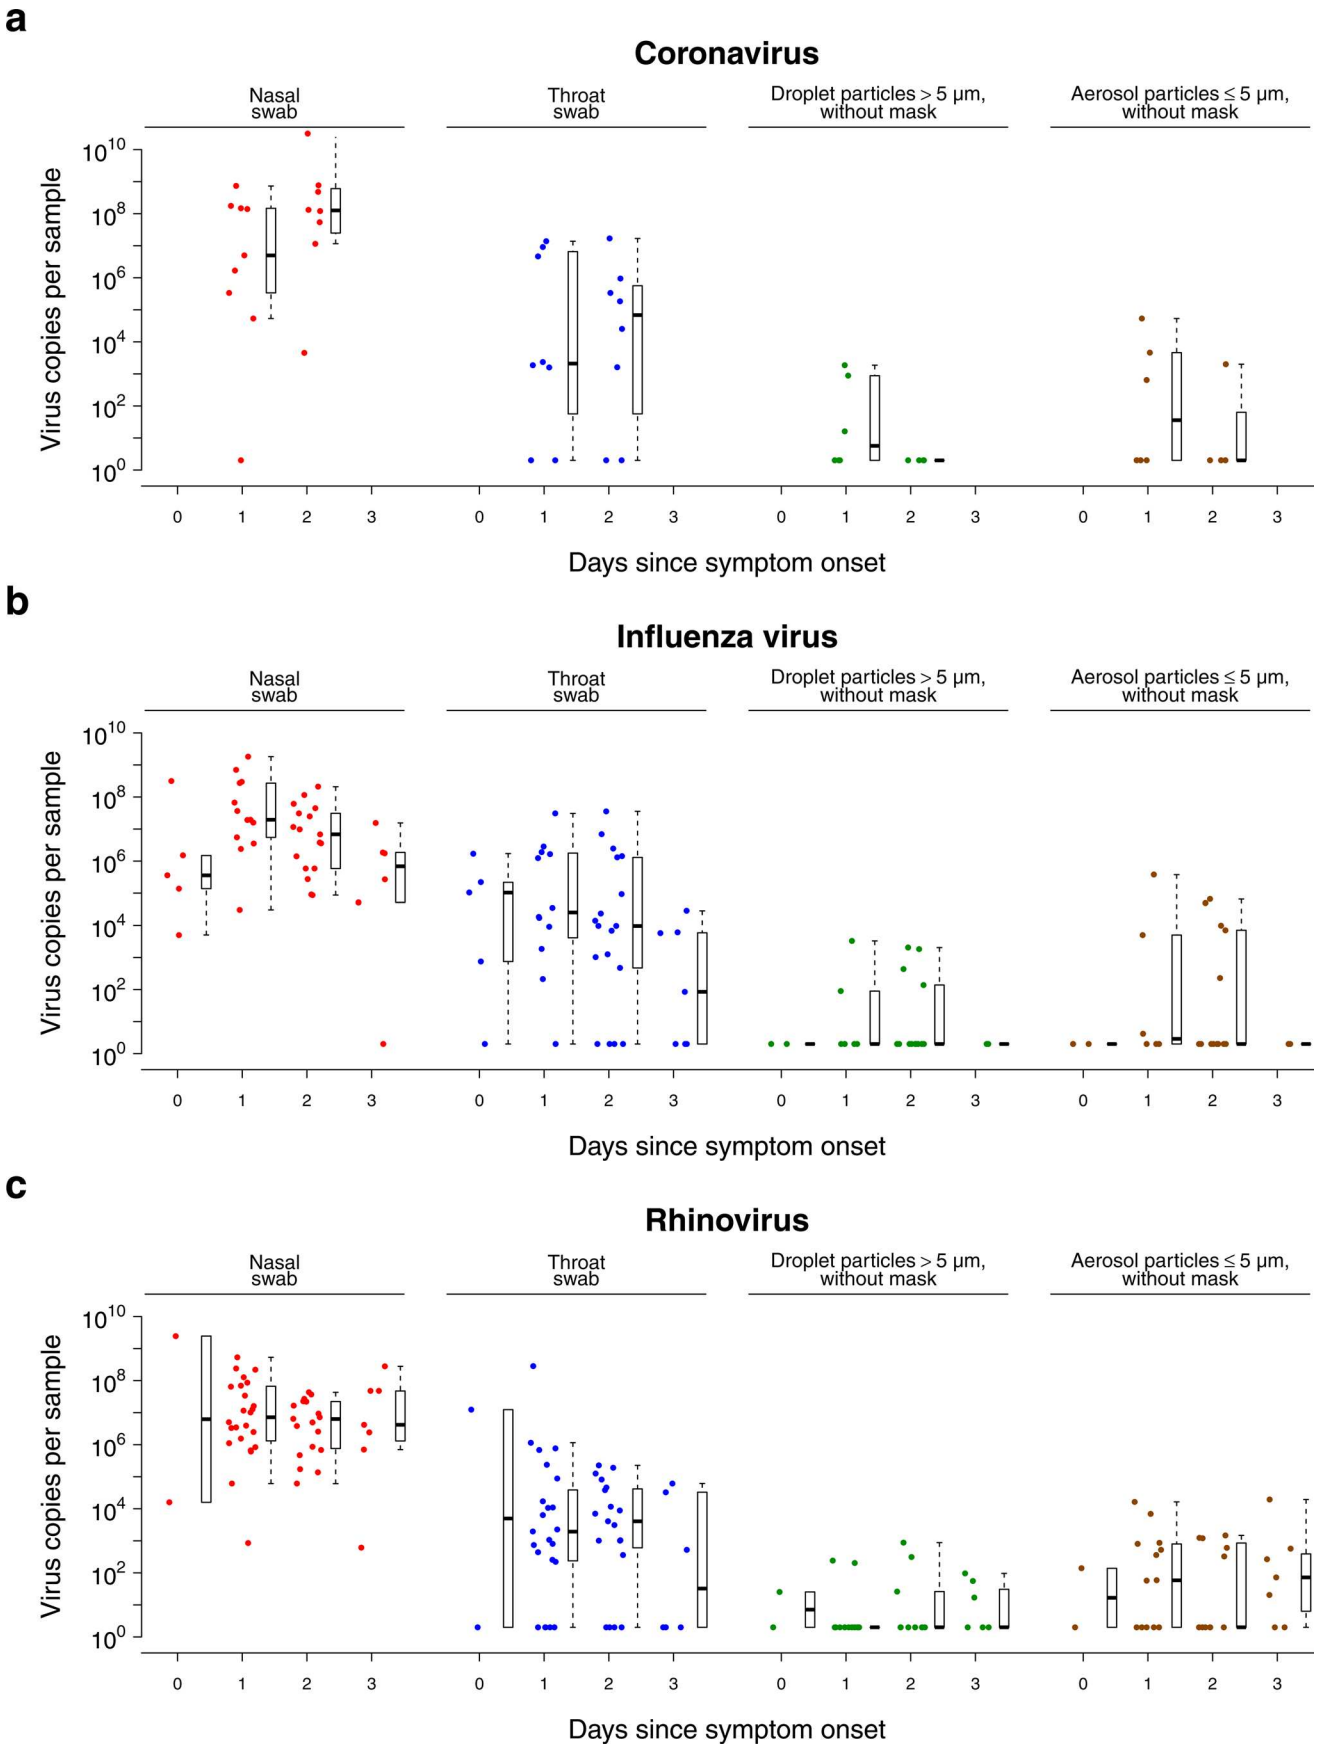
Extended Data Fig. 6 | Correlation of coronavirus viral shedding between different samples (nasal swab, throat swab, respiratory droplets and aerosols) in symptomatic individuals with seasonal coronavirus infection. For nasal swabs and throat swabs, all infected individuals were included (n = 17). For respiratory droplets and aerosols, only infected individuals who provided exhaled breath samples while not wearing a surgical face mask were included (n = 10). r, the Spearman's rank correlation coefficient.



Extended Data Fig. 7 | Correlation of influenza viral shedding between different samples (nasal swab, throat swab, respiratory droplets and aerosols) in symptomatic individuals with seasonal influenza infection. For nasal swabs and throat swabs, all infected individuals were included (n = 43). For respiratory droplets and aerosols, only infected individuals who provided exhaled breath samples while not wearing a surgical face mask were included (n = 23). r, the Spearman's rank correlation coefficient.



Extended Data Fig. 8 | Correlation of rhinovirus viral shedding between different samples (nasal swab, throat swab, respiratory droplets and aerosols) in symptomatic individuals with rhinovirus infection. For nasal swabs and throat swabs, all infected individuals were included (n = 54). For respiratory droplets and aerosols, only infected individuals who provided exhaled breath samples while not wearing a surgical face mask were included (n = 36). r, the Spearman's rank correlation coefficient.



Extended Data Fig. 9 | See next page for caption.

Extended Data Fig. 9 | Respiratory virus shedding in respiratory droplets and aerosols stratified by days from symptom onset for (a) coronavirus, (b) influenza virus or (c) rhinovirus. The figures shows the virus copies per sample collected in nasal swab (red), throat swab (blue), respiratory droplets (dark green) and aerosols (brown) collected for 30 min while not wearing a surgical face mask, stratified by the number of days from symptom onset on which the respiratory droplets and aerosols were collected. For nasal swabs and throat swabs, all infected individuals were included (coronavirus, n = 17; influenza virus, n = 43; rhinovirus, n = 54). For respiratory droplets and aerosols, numbers of infected individuals who provided exhaled breath samples while not wearing or wearing a surgical face mask, respectively were: coronavirus (n = 10 and 11), influenza virus (n = 23 and 28), rhinovirus (n = 36 and 32). A subset of participants provided exhaled breath samples for both mask interventions (coronavirus, n = 4; influenza virus, n = 8; rhinovirus, n = 14). The box plots indicate the median with the interquartile range (lower and upper hinge) and ±1.5 × interquartile range from the first and third quartile (lower and upper whisker).

Reporting Summary

Nature Research wishes to improve the reproducibility of the work that we publish. This form provides structure for consistency and transparency in reporting. For further information on Nature Research policies, see Authors & Referees and the Editorial Policy Checklist.

Statistics

For all statistical analyses, confirm that the following items are present in the figure legend, table legend, main text, or Methods section.

n/a	Confirmed	
☐	☒	The exact sample size (*n*) for each experimental group/condition, given as a discrete number and unit of measurement
☐	☒	A statement on whether measurements were taken from distinct samples or whether the same sample was measured repeatedly
☐	☒	The statistical test(s) used AND whether they are one- or two-sided *Only common tests should be described solely by name; describe more complex techniques in the Methods section.*
☐	☒	A description of all covariates tested
☐	☒	A description of any assumptions or corrections, such as tests of normality and adjustment for multiple comparisons
☐	☒	A full description of the statistical parameters including central tendency (e.g. means) or other basic estimates (e.g. regression coefficient) AND variation (e.g. standard deviation) or associated estimates of uncertainty (e.g. confidence intervals)
☐	☒	For null hypothesis testing, the test statistic (e.g. *F*, *t*, *r*) with confidence intervals, effect sizes, degrees of freedom and *P* value noted *Give P values as exact values whenever suitable.*
☒	☐	For Bayesian analysis, information on the choice of priors and Markov chain Monte Carlo settings
☒	☐	For hierarchical and complex designs, identification of the appropriate level for tests and full reporting of outcomes
☐	☒	Estimates of effect sizes (e.g. Cohen's *d*, Pearson's *r*), indicating how they were calculated

Our web collection on statistics for biologists contains articles on many of the points above.

Software and code

Policy information about availability of computer code

Data collection	No software was used.
Data analysis	All analyses were conducted with R version 3.6.0 and the VGAM package 1.1.1.

For manuscripts utilizing custom algorithms or software that are central to the research but not yet described in published literature, software must be made available to editors/reviewers. We strongly encourage code deposition in a community repository (e.g. GitHub). See the Nature Research guidelines for submitting code & software for further information.

Data

Policy information about availability of data

All manuscripts must include a data availability statement. This statement should provide the following information, where applicable:

- Accession codes, unique identifiers, or web links for publicly available datasets
- A list of figures that have associated raw data
- A description of any restrictions on data availability

Anonymized raw data and R syntax to reproduce all the analyses, figures, tables and supplementary tables in the published article are available at: [Dryad link pending].

Field-specific reporting

Please select the one below that is the best fit for your research. If you are not sure, read the appropriate sections before making your selection.

All studies must disclose on these points even when the disclosure is negative.

Sample size	We estimated a priori the sample size to be 300 participants. The primary outcome of the study was the reduction in the exhaled virus concentration of normal tidal breathing by wearing face mask in terms of total virus by RT-PCR as a proxy for infectious virus particle. We expected that a 1-log reduction in exhaled virus particle by face mask intervention would have a clinically relevant effect in reducing the probability of transmission. Except for influenza, there was no quantitative data available from exhaled breath samples from respiratory virus-infected individuals before the present study. If the standard deviation of exhaled virus concentration was 1 log copies/ml (Milton et al., PLoS Pathog 2013), we would detect a difference of >1 log copies/ml in the mask vs control group as long as we have >15 participants with a specific respiratory virus. For example, if our study included 23 participants with rhinovirus detectable in exhaled breath without a mask, we will have 80% power and 0.05 significance level to identify differences in viral shedding in aerosols of 1.28 log10 copies associated with the use of face masks, assuming a standard deviation of 1.54 log10 copies based on data from nasal and throat swab (Lu et al., J Clin Microbiol 2008). We expected from 300 individuals with ARI, at least 150 to have a respiratory virus, and at least 20-30 to have each of rhinovirus, coronavirus, adenovirus and parainfluenza plus small numbers of other respiratory viruses, assuming the Viral Panel would detect respiratory viruses in 60% of participants including 10% by influenza (since we partly recruited during the influenza seasons) and the other 50% made up of rhinovirus, coronavirus, adenovirus and parainfluenza virus.
Data exclusions	As described in the Results section and Supplementary Figure 1, only participants who provided exhaled breath samples and randomized to mask intervention were included; and final analyses were performed only for participants with either coronavirus, influenza virus or rhinovirus infection, which had sufficient sample size for comparison between mask intervention.
Replication	Samples from a subset of participants identified with a coronavirus, influenza or rhinovirus infection were re-tested by RT-PCR with consistent results. R syntax is available to reproduce all the analyses, figures, tables and supplementary tables in the published article.
Randomization	Prior to the exhaled breath collection, each participant was randomly allocated in a 1:1 ratio to either wearing a surgical face mask or not during the exhaled breath collection using a computer-generated sequence. The allocation was concealed to the study stuff performing the exhaled breath collection before allocation of the mask intervention.
Blinding	Blinding to the participant and the study stuff for the mask intervention was not possible. The study staff performing the statistical analyses was also involved in the data collection. We expected there would be minimal bias due to unblinding since data collection for questionnaires was done before randomization to mask intervention, and viral load from a sample measured by RT-PCR is an objective measurement.

Reporting for specific materials, systems and methods

We require information from authors about some types of materials, experimental systems and methods used in many studies. Here, indicate whether each material, system or method listed is relevant to your study. If you are not sure if a list item applies to your research, read the appropriate section before selecting a response.

Materials & experimental systems

n/a	Involved in the study
☒	☐ Antibodies
☐	☒ Eukaryotic cell lines
☒	☐ Palaeontology
☒	☐ Animals and other organisms
☐	☒ Human research participants
☐	☒ Clinical data

Methods

n/a	Involved in the study
☒	☐ ChIP-seq
☒	☐ Flow cytometry
☒	☐ MRI-based neuroimaging

Eukaryotic cell lines

Policy information about cell lines

Cell line source(s)	Madin-Darby Canine Kidney (MDCK) cells
Authentication	European Collection of Authenticated Cell Cultures.
Mycoplasma contamination	We confirm that all cell lines tested negative for mycoplasma contamination.
Commonly misidentified lines (See ICLAC register)	Nil

Human research participants

Policy information about studies involving human research participants

Population characteristics	As described in the Results section, Table 1a and Supplementary Table 1, there were some differences in characteristics of participants with the different viruses. Overall, most participants were younger adults and 5% were age 11-17 years, but there were more children with influenza virus and no children in the subgroup with coronavirus infection. Overall, 59% were female, but there were more females among the subgroup with coronavirus infection. The majority of participants did not have underlying medical conditions and overall 9% had received influenza vaccination for the current season but only 2% among those with influenza virus infection. The majority of participants were sampled within 24–48 or 48–72 hours of illness onset. 24% of participants had a measured fever ≥37.8ºC, with influenza patients more than twice as likely than coronavirus and rhinovirus-infected patients to have a measured fever. Coronavirus-infected participants coughed the most with an average of 17 (SD 30) coughs during the 30-minute exhaled breath collection. The profile of the participants randomized to with-mask vs without-mask groups were similar.
Recruitment	As described in the Methods section, participants were recruited year-round from March 2013 through May 2016 in a general outpatient clinic of a private hospital in Hong Kong. As routine practice, clinic staff screened all individuals attending the clinics for respiratory and any other symptoms regardless of the purpose of the visit at the triage. Study staff then approached immediately those who reported at least one of the following symptoms of acute respiratory illness (ARI) for further screening: fever≥37.8ºC, cough, sore throat, runny nose, headache, myalgia and phlegm. Individuals who reported ≥2 ARI symptoms, within 3 days of illness onset and ≥11 years of age were eligible to participate.
Ethics oversight	As described in the Methods section, the study protocol was approved by the Institutional Review Board of The University of Hong Kong and the Clinical and Research Ethics Committee of Hong Kong Baptist Hospital.

Note that full information on the approval of the study protocol must also be provided in the manuscript.

Clinical data

Policy information about clinical studies

All manuscripts should comply with the ICMJE guidelines for publication of clinical research and a completed CONSORT checklist must be included with all submissions.

Clinical trial registration	The present study was not registered in clinical trials registries, as it was a laboratory-based study of detection of viruses in exhaled breath and the effect of wearing surgical facemasks on virus detection. It was not a Phase II/III clinical trial.
Study protocol	Not available in clinical trials registries (as above). Study protocol will be made available to editors and peer reviewers if requested.
Data collection	As described in the Methods section, participants were recruited year-round from March 2013 through March 2016 in a general outpatient clinic of a private hospital in Hong Kong. Data collection for questionnaires and exhaled breath sample collection was done face-to-face with the participant by trained study staff at the same clinic on the day of participant enrolment.
Outcomes	As pre-specified in the study protocol, the primary outcomes of the study were the virus generation rate in the tidal breathing of participants infected by different respiratory viruses, and the efficacy of face mask in preventing virus dissemination in exhaled breath especially at the aerosol fraction. As pre-specified in the study protocol, one of the secondary outcomes was to provide indirect evidence for relative importance of different transmission routes of influenza and other respiratory viruses. In this regard, in the present manuscript we examined the correlation between viral shedding in nose swabs, throat swabs, respiratory droplets and aerosols, and factors affecting viral shedding in respiratory droplets and aerosols. As described in the Discussion section in the present manuscript about the limitation of our study, there was large proportion of participants with undetectable viral shedding in exhaled breath for each of the viruses studied, and therefore we were unable to examine the exhaled respiratory virus reduction proportion by chi-squared test, nor the exhaled respiratory virus reduction volume (i.e. viral load) by t-test and linear regression as pre-specified in the study protocol. Instead, we have used Fisher's exact test and Tobit regression for the same purposes respectively.

Hi All,

It has come to my attention that it's impossible to enter a response to Q12. You can send me a response directly to that question, or use the attached spreadsheet if you haven't started the rest of your responses.

All apologies,

Evan

Subject: Expert judgement for SARS-CoV-2 risk assessment for North American bats

Hello experts,

Thank you for volunteering your time and expertise to help estimate the risk of SARS-CoV-2 to North American bats. Mike Runge and I (Evan Grant), with the U.S. Geological Survey Patuxent Wildlife Research Center, are facilitating this effort in collaboration with the USGS National Wildlife Health Center, USGS Fort Collins Science Center, USFWS, and EcoHealth Alliance. We are conducting a rapid assessment of the risks for transmission of SARS-CoV-2 from humans to bats. The goal is to provide scientific information that will guide wildlife management agency response to this potential risk, including development of management recommendations and mitigation strategies.

Attached please find two documents: (1) an introduction to expert elicitation with some background on the issue we are addressing, and (2) a spreadsheet <BatEE Practice Questions v2.xlsx> with calibration questions. There are three tabs (corresponding to the three questions) in the accompanying spreadsheet, and a fourth tab that summarizes the responses and the calculated mean and standard deviation for each question.

We have a very tight timeline to provide guidance to U.S. management agencies, so we thank you for your participation along the following timeline:

i. Respond to ehgrant [redacted] with your responses to the calibration questions in the attached spreadsheet (due by 12 PM ET 10 Apr)
ii. Review the background information and elicitation questions (we will send these additional documents to you by 6 pm ET 10 Apr)
iii. Respond with your initial responses to the questions (due by 6 PM ET 13 Apr)
iv. Be available for a 2-hr conference call to discuss initial responses and share insights (4 PM ET 14 Apr – and/or – 4 PM ET 15 Apr)
v. Revise and send your second-round responses to the questions (due 24 hours after the last conference call)

Thank you in advance for your participation. If you have questions – please contact Evan (ehgrant [redacted].

Kindest regards,
Evan and Mike

1		Now consider a wildlife control operator (WC) who is actively shedding SARS-CoV-2 virus, performing their routine activities that involve handling bats, in the absence of any new restrictions, regulations, or protocols. For example, a typical activity might involve capturing bats in a home or trapping and transporting bats from an attic.				
2	Q6	6. If that WC operator **directly handles** 100 average little brown bats, how many of those bats do you estimate will be exposed to a sufficient viral dose of SARS-CoV-2 that they could become infected?				
3						Assume: logi
4				logit(x)		Quantile
5		What is the lowest reasonable estimate?		Error: must be between 0 and 100		0.5
6		What is the highest reasonable estimate?		Error: must be between 0 and 100		0.5
7		What is your central estimate?		Error: must be between 0 and 100		0.5
8		How confidence are you that the true mean is between your low and high estimates?		Error: Confidence should be >50		
9		(Confidence should be a number between 50 and 100)

1		Consider your response to question 1, regarding exposure through handling by RSM scientists. The new guidance and protocols consist of: restriction of fieldwork to people without symptoms and without contact with someone who had symptoms of COVID-19 in the last 14 days; proper training and compliance protocols for the use of PPE; proper use of Tyvek or other dedicated clothing; proper use of an N95 respirator; and proper use of gloves for handling bats. In these questions, please assume that the biologists have proper training, have access to PPE, and are using it appropriately.				
2	Q9	9. By what proportion should this exposure probability be multiplied if the new guidance and protocols are put into place? (Note that a proportion of 1 means there would be no change in exposure probability; a proportion of less than 1 would indicate a reduction in exposure probability; and a proportion of greater than 1 would indicate an increase in exposure probability as a result of such guidance.)				
3						Assume: log
4				ln(x)		Quantile
5		What is the lowest reasonable estimate?		Error: proportion must be >0		0.5
6		What is the highest reasonable estimate?		Error: proportion must be >0		0.5
7		What is your central estimate?		Error: proportion must be >0		0.5
8		How confidence are you that the true mean is between your low and high estimates?		Error: Confidence should be >50		
9		(Confidence should be a number greater than 50 and less than 100)

1	**Open-ended response**. Are there reasons to believe that the proportional change in the handling and proximity exposure probabilities for wildlife rehabilitators (WR) and wildlife control operators (WC), owing to the same protocol guidance, would be different than for scientists involved in research, survey, and management (RSM)? Explain.

2	Q13	13. What is R_0 for SARS-CoV-2 in little brown bats during the active season? That is, for each infected little brown bat, how many other little brown bats would become infected with the virus? Note that R_0 can be less than 1, in which case you can think of it as the probability that an infected bat will infect one other bat, or it can be greater than 1, in which case each infected bat infects more than one other bat. Note that the spreadsheet calculates from your responses (in cell D13) the probability that R_0 is greater than 1.				
3						Assume: log
4				ln(x)		Quantile
5		What is the lowest reasonable estimate?		Error: R0 must be >0		0.5
6		What is the highest reasonable estimate?		Error: R0 must be >0		0.5
7		What is your central estimate?		Error: R0 must be >0		0.5
8		How confidence are you that the true mean is between your low and high estimates?		Error: Confidence should be >50		
9		(Confidence should be a number between 50 and 100)				
10					x	ln(x)

Thanks Jon!

On Wed, Apr 15, 2020 at 7:15 PM Towner, Jonathan (Jon) (CDC/DDID/NCEZID/DHCPP) [redacted] wrote:

> Some food for thought while considering the effectiveness (or not) of bat workers/researchers putting on some kind of respiratory protection. This data, collected pre-COVID19, basically shows that putting on surgical masks can be effective for minimizing the spread of human coronaviruses, although the total number of patients tested was still pretty low and we don't know the extent to which COVID-19 can be spread in aerosolized form. Note that the masks weren't that effective for rhinoviruses or aerosolized flu.

Subject: Re: Expert judgement for SARS-CoV-2 risk assessment for North American bats

Hi Jon,

Thanks for passing this along. So others don't have to dig through all of the the 2.5 page table full of abbreviations, here are some scores (matching residues of the 20 key AAs considered) for a few selected species which might be relevant to judging the susceptibility of Myotis lucifugus, which had a score of 11/20:

Homo sapiens (20/20)

Sus scrofa (15/20), in vitro evidence of infection

Mustela putorius furo (15/20), in vivo susceptibility confirmed

Rhinolophus macrotis (13/20), susceptible?

Rhinolophus pusillus (14/20), susceptible?

Rhinolophus ferrumequinum (12/20), susceptible?

Desmodus rotundus (12/20), possibly susceptible (same family as Artibeus, which was not included in the study)?

So, Myotis is relatively low on the list, but so are bats which are related to the presumed reservoir and known susceptible species like ferrets are not too much higher up on the list. I'd be curious to know how others with more knowledge than myself interpret these numbers. Is this measure of ACE-2 affinity something we should use and how low is too low for a host to be susceptible?

Best,

Daniel

Hello experts,

Thank you for volunteering your time and expertise to help estimate the risk of SARS-CoV-2 to North American bats. Mike Runge and I (Evan Grant), with the U.S. Geological Survey Patuxent Wildlife Research Center, are facilitating this effort in collaboration with the USGS National Wildlife Health Center, USGS Fort Collins Science Center, USFWS, and EcoHealth Alliance. We are conducting a rapid assessment of the risks for transmission of SARS-CoV-2 from humans to bats. The goal is to provide scientific information that will guide wildlife management agency response to this potential risk, including development of management recommendations and mitigation strategies.

Attached please find two documents: (1) an introduction to expert elicitation with some background on the issue we are addressing, and (2) a spreadsheet <BatEE Practice Questions v2.xlsx> with calibration questions. There are three tabs (corresponding to the three questions) in the accompanying spreadsheet, and a fourth tab that summarizes the responses and the calculated mean and standard deviation for each question.

We have a very tight timeline to provide guidance to U.S. management agencies, so we thank you for your participation along the following timeline:

i. Respond to ehgrant[redacted] with your responses to the calibration questions in the attached spreadsheet (due by 12 PM ET 10 Apr)

ii. Review the background information and elicitation questions (we will send these additional documents to you by 6 pm ET 10 Apr)

iii. Respond with your initial responses to the questions (due by 6 PM ET 13 Apr)

iv. Be available for a 2-hr conference call to discuss initial responses and share insights (4 PM ET 14 Apr – and/or – 4 PM ET 15 Apr)

v. Revise and send your second-round responses to the questions (due 24 hours after the last conference call)

Thank you in advance for your participation. If you have questions – please contact Evan (ehgrant[redacted]

Kindest regards,

Evan and Mike

Great discussion! Thanks for forwarding the paper Jon, and thanks for summarizing the data Dan.
Receptor binding studies are a great and practical first step, however, susceptibility is far more complex than receptor binding. Many processes must be overcome to infect a new species and experiments are probably the only way to definitively determine susceptibility.
I reached out to Tony S to see if he had insights about Artibeus jamaicensis (susceptible) with respect to the AA considered in the paper – he looked through his transcriptome data and noted it has 13 matched AAs.
I look forward to more discussion tomorrow.
Raina

This data, collected pre-COVID19, basically shows that putting on surgical masks can be effective for minimizing the spread of human coronaviruses, although the total number of patients tested was still pretty low and we don't know the extent to which COVID-19 can be spread in aerosolized form. Note that the masks weren't that effective for rhinoviruses or aerosolized flu.

Subject: Re: Expert judgement for SARS-CoV-2 risk assessment for North American bats

Hi Jon,

Thanks for passing this along. So others don't have to dig through all of the the 2.5 page table full of abbreviations, here are some scores (matching residues of the 20 key AAs considered) for a few selected species which might be relevant to judging the susceptibility of Myotis lucifugus, which had a score of 11/20:

Homo sapiens (20/20)
Sus scrofa (15/20), in vitro evidence of infection
Mustela putorius furo (15/20), in vivo susceptibility confirmed
Rhinolophus macrotis (13/20), susceptible?
Rhinolophus pusillus (14/20), susceptible?
Rhinolophus ferrumequinum (12/20), susceptible?
Desmodus rotundus (12/20), possibly susceptible (same family as Artibeus, which was not included in the study)?

So, Myotis is relatively low on the list, but so are bats which are related to the presumed reservoir and known susceptible species like ferrets are not too much higher up on the list. I'd be curious to know how others with more knowledge than myself interpret these numbers. Is this measure of ACE-2 affinity something we should use and how low is too low for a host to be susceptible?

Best,
Daniel

Abstract

The novel coronavirus SARS-CoV-2 is the cause of Coronavirus Disease-2019 (COVID-19). The main receptor of SARS-CoV-2, angiotensin I converting enzyme 2 (ACE2), is now undergoing extensive scrutiny to understand the routes of transmission and sensitivity in different species. Here, we utilized a unique dataset of 410 vertebrates, including 252 mammals, to study cross-species conservation of ACE2 and its likelihood to function as a SARS-CoV-2 receptor. We designed a five-category ranking score based on the conservation properties of 25 amino acids important for the binding between receptor and virus, classifying all species from *very high* to *very low*. Only mammals fell into the *medium* to *very high* categories, and only catarrhine primates in the *very high* category, suggesting that they are at high risk for SARS-CoV-2 infection. We employed a protein structural analysis to qualitatively assess whether amino acid changes at variable residues would be likely to disrupt ACE2/SARS-CoV-2 binding, and found the number of predicted unfavorable changes significantly correlated with the binding score. Extending this analysis to human population data, we found only rare (<0.1%) variants in 10/25 binding sites. In addition, we observed evidence of positive selection in ACE2 in multiple species, including bats. Utilized appropriately, our results may lead to the identification of intermediate host species for SARS-CoV-2, justify the selection of animal models of COVID-19, and assist the conservation of animals both in native habitats and in human care.

Keywords: SARS-CoV-2, COVID-19, ACE2, comparative genomics, host range, species conservation, evolution

Introduction

The 2019-novel coronavirus (2019-nCoV, also, SARS-CoV-2 and COVID-19 virus) is the cause of Coronavirus Disease-2019 (COVID-19), a major pandemic that threatens millions of lives and the global economy (1). Comparative analysis of SARS-CoV-2 and related coronavirus sequences has shown that SARS-CoV and SARS-CoV-2 likely originated in bats, followed by transmission to an intermediate host, and that both viruses may have an extended host range that includes primates and other mammals (1–3). However, the immediate source population/species for SARS-CoV and SARS-CoV-2 viruses has not yet been identified. Several mammalian species host coronaviruses, and these infections are frequently associated with severe clinical diseases, such as respiratory and enteric disease in pigs and cattle (4, 5). Molecular phylogenetics revealed that at least one human coronavirus (HCov-OC43), may have originated in cattle or swine (6), and that this virus was associated with a human pandemic that emerged in the late 19th century (7). Recent data indicate that coronaviruses can move from bats to other wildlife species and humans (8) and from humans to tigers (9) and pigs (10). Therefore, understanding the host range of SARS-CoV-2 and related coronaviruses is essential for improving our ability to predict and control future pandemics. It is also crucial for protecting populations of wildlife species in native habitats and under human care, particularly non-human primates, who may also be susceptible to COVID-19 (11).

The angiotensin I converting enzyme 2 (ACE2) serves as a functional receptor for the spike protein (S) of SARS-CoV and SARS-CoV-2 (12, 13). Under normal physiological conditions, ACE2 is a dipeptidyl carboxypeptidase that catalyzes the conversion of angiotensin I into angiotensin 1-9, a peptide of unknown function, and angiotensin II, a vasoconstrictor that is important in the regulation of blood pressure (14). ACE2 also converts angiotensin II into angiotensin 1-7, a vasodilator that affects the cardiovascular system (14) and may regulate other components of the renin-angiotensin system (15). The host range of SARS-CoV-2 may be extremely broad due to the conservation of ACE2 in mammals (2, 13) and its expression on ciliated bronchial epithelial cells and type II pneumocytes (10). While coronaviruses related to SARS-CoV-2 use ACE2 as a primary receptor, coronaviruses may use other proteases as receptors, such as CD26 (DPP4) for MERS-CoV (16), thus limiting or extending their host range.

In humans, ACE2 may be a cell membrane protein or it may be secreted (14). The secreted form is created primarily by enzymatic cleavage of surface-bound ACE2 by ADAM17 and other proteases (14). Sequence variation in *ACE2* affects the protein's functions. *ACE2* is polymorphic in humans, with many

synonymous and nonsynonymous mutations identified, although most are rare at the population level (17) and few are believed to affect cellular susceptibility to human coronavirus infections (18). Site-directed mutagenesis and co-precipitation of SARS-CoV constructs have revealed critical residues on the ACE2 tertiary structure that are essential for binding to the virus receptor binding domain (RBD) (19). These findings have been strongly supported by co-crystallization and the structural determination of the SARS-CoV and SARS-CoV-2 S proteins with human ACE2 (13, 20, 21), as well as binding-affinity with heterologous ACE2 (19). The RBD of human coronaviruses may mutate to change the binding affinity of S for ACE2, and thus lead to adaptation in humans or other hosts. The best studied example is the palm civet, believed to have been the intermediate host between bats and humans for SARS-CoV (2). To date, an intermediate host for SARS-CoV-2 has not been identified definitively, although Malayan pangolins (*Manis javanica*) have been proposed as a possible reservoir (22).

Comparative analysis of ACE2 nucleotide and protein sequences can predict their ability to bind SARS-CoV-2 S and therefore will yield important insights into the biology and potential zoonotic transmission of SARS-CoV-2 infection. Recent work has examined ACE2 from different vertebrate species and predicted its ability to bind SARS-CoV-2 S, but phylogenetic sampling was extremely limited (11, 23). Here, we made use of sequenced genomes of 410 vertebrates and protein structural analysis, to identify ACE2 homologs in all vertebrate classes (fishes, amphibians, birds, reptiles, and mammals) that have the potential to serve as a receptor for SARS-CoV-2, and to understand the evolution of ACE2 SARS-CoV-2 S binding sites. Our results reinforce earlier findings on the natural host range of SARS-CoV-2, and predict a broader group of species that may serve as a reservoir or intermediate host for this virus. Importantly, many threatened and endangered species were found to be at potential risk for SARS-CoV-2 infection, suggesting that as the pandemic spreads, humans could inadvertently introduce a potentially devastating new threat to these already vulnerable populations, especially for great apes and other primates.

Results

Comparison of vertebrate ACE2 sequences and their predicted ability to bind SARS-CoV-2. We identified 410 unique vertebrate species with *ACE2* orthologs (Dataset S1) that included representatives of all vertebrate taxonomic classes. Among these were 252 mammals, 72 birds, 65 fishes, 17 reptiles and 4 amphibians. Twenty-five amino acids corresponding to known SARS-CoV-2 S-binding residues (11, 13, 21) were examined for their similarity to the residues in human ACE2 (Fig. 1, Dataset S1). On the basis of

known interactions between specific residues on ACE2 and the RBD of SARS-CoV-2 S, a set of rules was developed for predicting the likelihood of S binding to ACE2 from each species (see Materials and Methods). Five score categories were predicted: *very high*, *high*, *medium*, *low* and *very low*. Results for all species and all SARS-CoV-2 S binding scores are shown in Dataset S1, and results for mammalian species are also shown in Fig. 1. The *very high* classification had at least 23/25 ACE2 residues identical to their human homolog and other constraints on substitutions at SARS-CoV-2 S binding hot spots (see Materials and Methods). The 18 species predicted as *very high* were all Old World primates and apes completely identical to human across the 25 ACE2 binding residues. The ACE2 proteins of 28 species were classified as having a *high* likelihood of binding the S RBD. Among them are twelve cetaceans, seven rodents, three cervids (deer), three lemuriform primates, two representatives of the order Pilosa (Giant anteater and Southern tamandua), and one Old World primate (Angola colobus, Fig. 1). Fifty-seven species scored as *medium* for the ability of their ACE2 to bind SARS-CoV-2 S. Like the *high* score, this category has at least 20/25 residues identical to human ACE2 but more relaxed constraints for critical binding residues. All species with *medium* score are mammals distributed across six orders.

Among Carnivora, 9/43 scored *medium*, 9/43 scored *low*, and 25/43 scored *very low* (Fig. 1). The carnivores scoring *medium* were only felids, including the domestic cat and Siberian tiger. Among the 13 Primates scoring *medium* there were 10 New World primates and three lemurs. Of 45 Rodentia species, 11 scored *medium*. Twenty-one Artiodactyls scored *medium*, including several important wild and domesticated ruminants, such as domesticated cattle, bison, sheep, goat, water buffalo, Masai giraffe, and Tibetan antelope. Species scoring *medium* also included 2/3 Lagomorphs and one Cetacean (sperm whale).

All chiropterans (bats) scored *low* (N=8) or *very low* (N=29) (Fig. 1), including the Chinese rufous horseshoe bat (*Rhinolophus sinicus*), from which a coronavirus very similar to SARS-CoV-2 was identified (1). Only 7.7% (3/39) primate species' ACE2 scored *low* or *very low,* and 61% of rodent species scored *low* (10/46) or *very low* (18/46). All monotremes (N=1) and marsupials (N=4) scored *very low*. All birds, fish, amphibians, and reptiles scored *very low*, with less than 18/25 ACE2 residues identical to the human and many non-conservative residues at the remaining non-identical sites (Dataset S1). Notable species scoring *very low* include the Chinese pangolin (*Manis pentadactyla*), Sunda pangolin (*Manis javanica*), and white-bellied pangolin (*Phataginus tricuspis*) (Fig. 1, Dataset S1).

Structural analysis of the ACE2/SARS-CoV-2 S binding interface. We complemented the sequence-identity based scoring scheme with a qualitative approach that combined structural homology

modeling and best fit rotamer positioning. We examined the 25 ACE2 binding residues in a subset of 28 representative species (Fig. S1) and 17 sites were variable and not glycosylation sites. First, we assessed the similarity of every contact at the binding interface between two recently solved crystal structures for the human ACE2/SARS-CoV-2 S RBD complex in humans, 6M0J and 6WV1 (13, 21). Both structures were in agreement except for the position of S19, which was excluded from subsequent analysis (24). We then generated homology models, and aligned them to the human ACE2/SARS-CoV-2 S RBD 6M0J structure. This showed a high degree of similarity along the Cα backbone (25) for each of the 28 species. We selected the most favorable rotamer at each residue using CHIMERA (Fig. S2).

We examined a total of 55 substitutions and assigned each to one of three types: *neutral* (N; likely to maintain similar contacts; 18 substitutions); *weaken* (W; likely to weaken the interaction; 14 substitutions); or *unfavorable* (U; likely to introduce unfavorable interactions; 23 substitutions) (Fig. S1). Our assignments show good agreement with those made in a second study (26) based on experimental data, with 83.4% of the 55 substitutions evaluated concordant between the two approaches (Fig. S1). The structural homology binding assessments support the sequence identity analysis, with the fraction of residues ranked as U, correlating very strongly with the substitution scoring scheme (Spearman correlation rho=0.76; $p< 2.2e-16$; Fig. 2).

Structural analysis of variation in human *ACE2*. We applied the same approach used to compare species, sequence identity and protein structural analysis, to examine the variation in ACE binding residues within humans, some of which have been proposed to alter binding affinity (18, 27–30). We integrated data from six different sources: dbSNP (31), 1KGP (32), Topmed (33), UK10K (34) and CHINAMAP (28), and identified a total of 11 variants in ten of the 25 ACE2 binding residues (Dataset S2). All variants found are rare, with allele frequency less than 0.01 in any populations, and less than 0.0007 over all populations. Three of the 11 variants were synonymous changes, seven were conservative missense variants, and one, S19P, was a semi-conservative substitution. S19P has the highest allele frequency of the 11 variants, with a global frequency of 0.0003 (17). We evaluated, by structural homology, six missense variants. Four were *neutral* and two weakening (E35K, frequency=0.000016; E35D, frequency=0.000279799). S19P was not included in our structural homology assessment, but a recent study predicted it would increase binding affinity (26). Thus, with an estimated summed frequency of 0.001, genetic variation in the ACE2 S-binding interface is overall rare, and it is unclear whether the variation that does exist increases or decreases susceptibility to infection.

Evolution of ACE2 across mammals. We next investigated the evolution of ACE2 variation in vertebrates, including how patterns of positive selection compare between bats, a mammalian lineage known to harbor a diversity of coronaviruses (35), and other mammalian clades. We first inferred the phylogeny of *ACE2* using our 410-vertebrate alignment and IQTREE, using the best-fit model of sequence evolution (JTT+F+R7) and rooting the topology on fishes (Dataset S3; Fig. S3). We then assayed sequence conservation with PhyloP (36). The majority of ACE2 codons are significantly conserved across vertebrates and across mammals, likely reflecting its critical function in the renin-angiotensin system (37) (Dataset S4.1), with ten residues in the ACE2 binding domain exceptionally conserved in Chiroptera and/or Rodentia (Dataset S4.2).

We next used phyloP and CODEML to test for acceleration and positive selection (36). PhyloP compares the rate of evolution at each codon to the expected rate in a model estimated from third nucleotide positions of the codon, and is agnostic to synonymous versus nonsynonymous substitutions (dN/dS). CODEML uses ω=dN/dS>1 and Bayes Empirical Bayes (BEB) scores to identify codons under positive selection, and was run on a subset of 64 representative mammals (see Materials and Methods).

ACE2 shows significant evidence of positive selection across mammals (ω=1.83, LRT=194.13, p<0.001; Dataset S4.3, 4.4). Almost 10% of codons (N=73; 9 near the RBD) are accelerated within mammals (Dataset S4.1, 4.5), and 18 of these have BEB scores greater than 0.95, indicating positively selected residues (Dataset S4.5, 4.6, Fig. S4). Nineteen accelerated residues, including two positively-selected codons (Q24, H34), are critical for the binding of the ACE2 RBD and SARS-CoV-2 S (Dataset S4.5; Fig. 3; Fig. S5). Q24 has not been observed to be polymorphic within the human population, and H34 harbors a synonymous polymorphism (AF=0.00063) but no non-synonymous polymorphisms (Dataset S2).

This pattern of acceleration and positive selection in *ACE2* also holds for individual mammalian lineages. Using CODEML, positive selection was detected within the orders Chiroptera (LRT=346.40, ω=3.44 p<0.001), Cetartiodactyla (LRT=92.86, ω=3.83, p<0.001), Carnivora (LRT=65.66, ω=2.27. p<0.001), Primates (LRT=72.33, ω=3.16, p<0.001) and Rodentia (LRT=91.26, ω=1.77, p<0.001). Overall, bats had more positively selected sites with significant BEB scores (29 sites in Chiroptera compared to 10, 8, 7 and 15 sites in Cetartiodactyla, Carnivora, Primates and Rodentia, respectively). Positive selection at key sites for the binding of ACE2 and SARS-CoV-2 was only found in the bat-specific alignment. PhyloP was used to assess shifts in evolutionary rate within mammalian lineages, for each assessing signal relative to a neutral model trained on species from the specified lineage (Dataset S4.6-11, Fig. S6). We discovered six important binding residues, five of which showed evidence for positive selection, that are accelerated in

one or more of Chiroptera, Rodentia, or Carnivora, with G354 accelerated in all of these lineages (Dataset S4.12).

Given pervasive signatures of adaptive evolution in *ACE2* across mammals, we next sought to test if any mammalian lineages are evolving particularly rapidly compared to the others. CODEML branch-site tests identified positive selection in both the ancestral Chiroptera branch (1 amino acid, ω=26.7, LRT= 4.22, p=0.039) and ancestral Cetartiodactyla branch (2 amino acids, ω=10.38, LRT= 7.89, p=0.004, Dataset S4.3) using 64 mammals. These residues did not correspond to known viral binding sites. We found no evidence for lineage-specific positive selection in the ancestral primate, rodent or carnivore lineages. PhyloP identified lineage-specific acceleration in Chiroptera, Carnivora, Rodentia, Artiodactyla and Cetaceans relative to mammals (Dataset S4.13-17, Fig. S7). Bats have a particularly high level of accelerated evolution (18 codons; $p<0.05$). Of these accelerated residues, T27 and M82 are known to be important for binding SARS-CoV-2, with some bat subgroups having amino acids predicted to lead to less favorable binding of SARS-CoV-2 (Fig. S1, Fig. S8). Surprisingly, a residue that is conserved overall in our 410 species alignment and in the mammalian subset, Q728, is perfectly conserved in all 37 species of bats except for fruit bats (Pteropodidae), which have a substitution from Q to E. These results support the theory that *ACE2* is under lineage-specific selective pressures in bats relative to other mammals.

Positive selection in SARS-CoV-2 S protein. Positive selection was found using CODEML at sites L455, E484, F490 and S494 in the SARS-CoV-2 S sequence (ω=1.15, LRT=116.7, $p<0.001$); however this signal was not particularly high, possibly due to the small sample size (N=8). All of these sites lie within or near the ACE2 SARS-CoV-2 S RBD binding sites (Fig. 3) (38).

Discussion

Phylogenetic analysis of coronaviruses has demonstrated that SARS-CoV-2 most likely originated in a bat species (1). However, whether SARS-CoV-2 or the progenitor of this virus was transmitted directly to humans or through an intermediary host is not yet resolved. To determine if amino acid substitution analysis and structural information could be used to identify candidate intermediate host species, we undertook a deep comparative genomic, evolutionary and structural analysis of ACE2, the SARS-CoV-2 receptor in humans. To accomplish this we drew on the rapidly growing dataset of annotated vertebrate genomes as well as predicted protein sequences from recently acquired whole genome sequences produced by the Genomes 10K-affiliated Bat1K Consortium, Zoonomia, and Vertebrate

Genomes Project, and other sources (39, 40). We conducted a phylogenetic analysis of ACE2 orthologs from 410 vertebrate species and made predictions of their likelihood to bind the SARS-CoV-2 S using a score that was based on amino acid substitutions at 25 consensus human ACE2 binding residues (13, 21). We supported these predictions with comprehensive homology modeling of the ACE2 binding site. We also tested the hypothesis that the ACE2 receptor is under selective constraints in different mammalian lineages, and correlated these results with data on the known species distribution of coronaviruses.
